Data Bootcamp Final Project

UCLA Graduate Admissions Dataset

Team: ***Yuyang Fu, Yangming Zhang***

Data Sources: Kaggle https://www.kaggle.com/mohansacharya/graduate-admissions (https://www.kaggle.com/mohansacharya/graduate-admissions)

Citation: Mohan S Acharya, Asfia Armaan, Aneeta S Antony : A Comparison of Regression Models for Prediction of Graduate Admissions, IEEE International Conference on Computational Intelligence in Data Science 2019

Table of Contents

1. Introduction

This project mainly focuses on what parameters are important for a student to get into UCLA graduate school, and how these factors are interrelated among themselves. It will also help predict candidates' chances of admission given the variables.

2. Data Import

In [1]:

```
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns
%matplotlib inline
```

In [2]:

```
df1 = pd.read_csv('Admission_Predict.csv')
df2 = pd.read_csv('Admission_Predict_Ver1.1.csv')
```

In [3]:

```
df = pd.concat([df1,df2])
```

Checking data types (which are int64 and float64)

In [4]:

```
df.dtypes
```

Out[4]:

```
Serial No.             int64
GRE Score              int64
TOEFL Score            int64
University Rating      int64
SOP                  float64
LOR                  float64
CGPA                 float64
Research               int64
Chance of Admit      float64
dtype: object
```

The dataset contains several parameters which are considered important during the application for Masters Programs
The parameters included are :

1. GRE Scores (out of 340)
2. TOEFL Scores (out of 120)
3. University Rating (out of 5)
4. Statement of Purpose (out of 5)
5. Letter of Recommendation Strength (out of 5)
6. Undergraduate GPA (out of 10)
7. Research Experience (either 0 or 1)
8. Chance of Admit (ranging from 0 to 1)

3. Data Filtering and Cleaning

Checking if there are any null values in the dataset

In [5]:

```
df.isnull().sum()
```

Out[5]:

```
Serial No.           0
GRE Score            0
TOEFL Score          0
University Rating    0
SOP                  0
LOR                  0
CGPA                 0
Research             0
Chance of Admit      0
dtype: int64
```

In [6]:

```
df.columns
```

Out[6]:

```
Index(['Serial No.', 'GRE Score', 'TOEFL Score', 'University Rating',
'SOP',
       'LOR ', 'CGPA', 'Research', 'Chance of Admit '],
      dtype='object')
```

Changing the names of columns for future editing

In [7]:

```
df.rename(columns={'GRE Score':'GRE_Score', 'TOEFL Score':'TOEFL_Score',
                   'University Rating':'University_Rating','Chance of Admit ':'Chanc
                  'LOR ':'LOR'},inplace=True)
```

In [8]:

```
df
```

Out[8]:

	Serial No.	GRE_Score	TOEFL_Score	University_Rating	SOP	LOR	CGPA	Research	Chance_of_Admit
0	1	337	118	4	4.5	4.5	9.65	1	0.92
1	2	324	107	4	4.0	4.5	8.87	1	0.76
2	3	316	104	3	3.0	3.5	8.00	1	0.72
3	4	322	110	3	3.5	2.5	8.67	1	0.80
4	5	314	103	2	2.0	3.0	8.21	0	0.65
5	6	330	115	5	4.5	3.0	9.34	1	0.90
6	7	321	109	3	3.0	4.0	8.20	1	0.75
7	8	308	101	2	3.0	4.0	7.90	0	0.68
8	9	302	102	1	2.0	1.5	8.00	0	0.50

Returning a tuple representing the dimensionality of the dataframe

In [9]:

```
df.shape
```

Out[9]:

```
(900, 9)
```

Grouping the chance of admit into 5 levels(which are HIGH, MEDIA HIGH, MEDIUM, MEDIUM LOW, LOW) by the interval of 0.1. The levels of the admit chance are more understanable and visualized, what's more, differentiating the data by the same interval makes it more convenient to compare with each group.

In [10]:

```
def acl(df):
    if df['Chance_of_Admit'] >= 0.9:
        return 'High'
    elif 0.9 > df['Chance_of_Admit'] >= 0.8:
        return 'Medium High'
    elif 0.8 > df['Chance_of_Admit'] >= 0.7:
        return 'Medium'
    elif 0.7 > df['Chance_of_Admit'] >= 0.6:
        return 'Medium Low'
    else:
        return 'Low'
```

Assuming here that students with 0.7 chance of admission have secured admission. Therefore we create another column named Admit. The value of Admit=1 if Chance>0.7 and Admit=0 if Chance<0.7.

In [11]:

```
def a(row):
    if row['Chance_of_Admit'] >0.7 :
        return 1
    else :
        return 0
```

In [12]:

```
df['Admit_Chance_Level'] = df.apply(acl, axis=1)
df['Admit'] = df.apply(a,axis=1)
```

In [13]:

```
df
```

Out[13]:

	Serial No.	GRE_Score	TOEFL_Score	University_Rating	SOP	LOR	CGPA	Research	Chance_of_Admit	Admit_
0	1	337	118	4	4.5	4.5	9.65	1	0.92	
1	2	324	107	4	4.0	4.5	8.87	1	0.76	
2	3	316	104	3	3.0	3.5	8.00	1	0.72	
3	4	322	110	3	3.5	2.5	8.67	1	0.80

The distributions of different variables

In [18]:

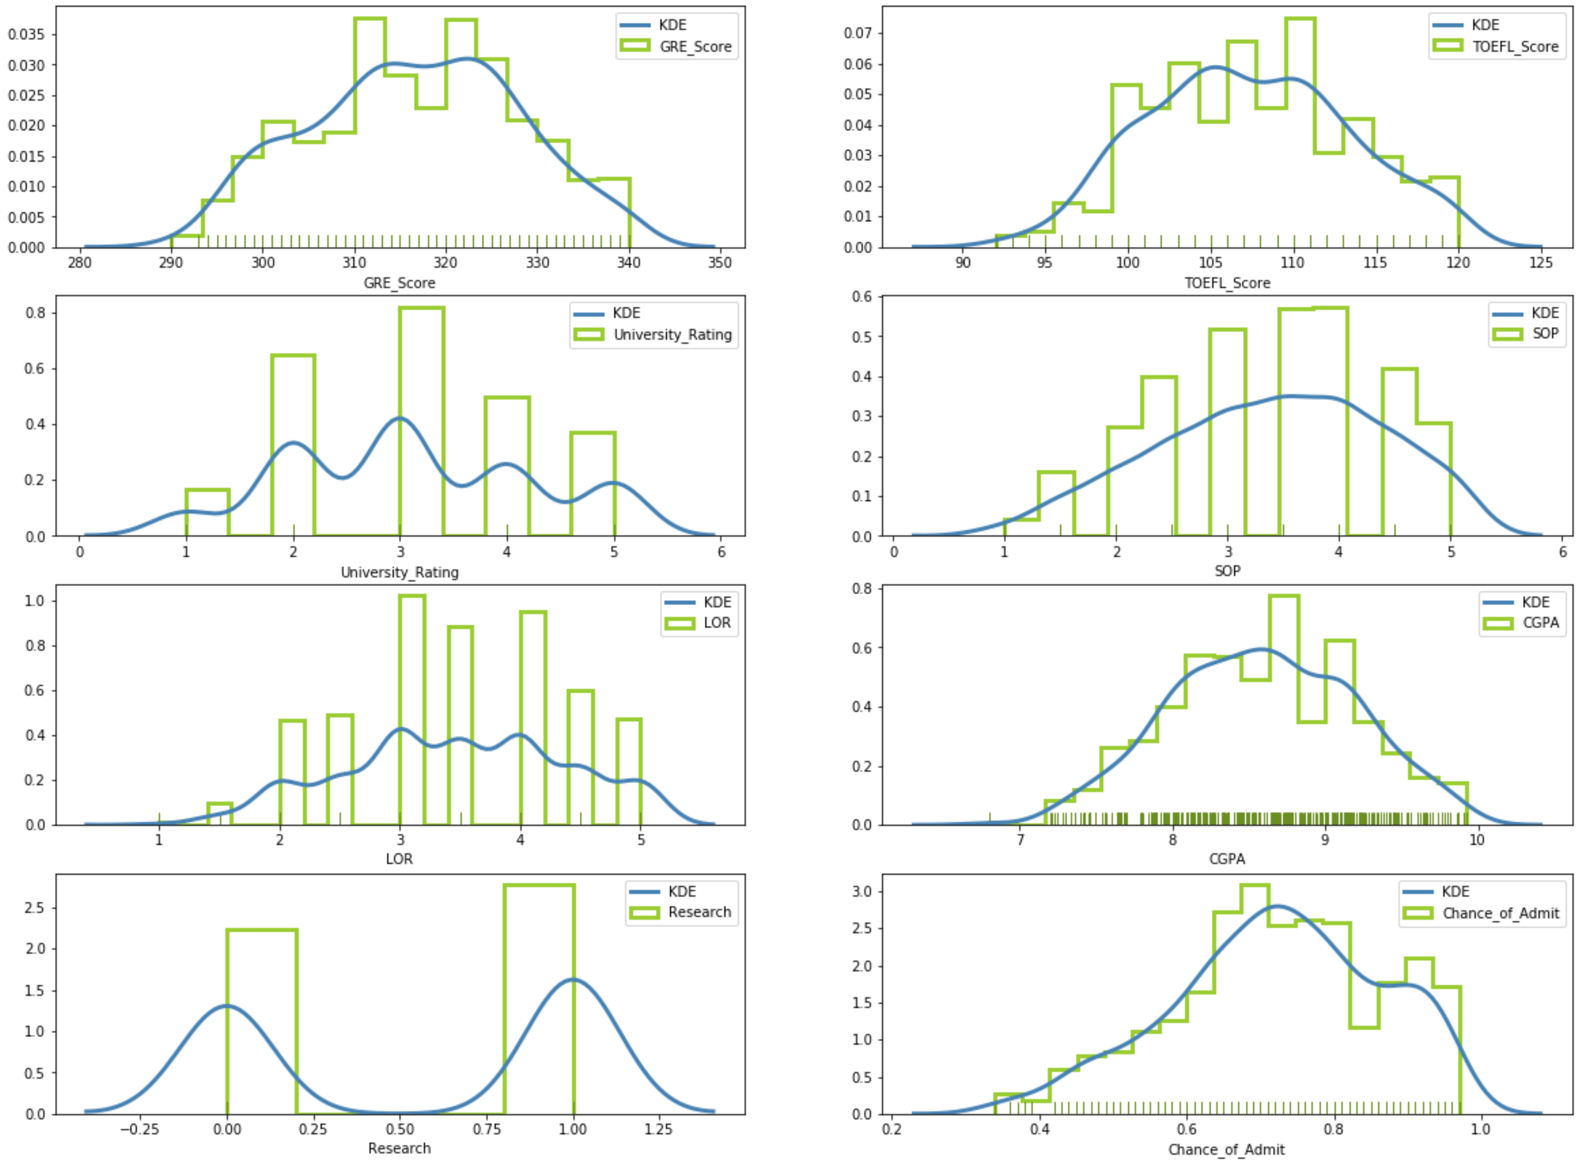
```
#Exclude the last three categorical data
numerical_data = merged.iloc[:,:8]
```

In [19]:

```
plt.figure(figsize=(20,15))
i = 0

for item in numerical_data.columns:
    i += 1
    plt.subplot(4, 2, i)
    sns.distplot(numerical_data[item], rug=True, rug_kws={"color": "olivedrab"},kde=
                 kde_kws={"color": "steelblue", "lw": 3, "label": "KDE"},
                 hist_kws={"histtype": "step", "linewidth": 3,"alpha": 1, "color": '
#     sns.distplot(admission_v1[item], kde=True,label="{0}".format(item))

plt.show()
```



TOEFL Score: The density of TOEFL score are between 100 and 105.
GRE Score: There is a density between 310 and 330. Being above this range would be a good feature for a candidate to stand out.
University Rating: Most of candidates come from score 3 university, and the candidates of score 2,3,4 are about half of that of score 3.
Statement of Purpose: The SoPs are mainly distributed between 2.5 and 5.
LOR: For most of candidates, their letters of recommendation are between 3 and 4.
CGPA: The CGPA are mainly distributed between 8.0 to 9.5.

Min,median and max values for GRE,TOEFL,University rating and CGPA.

In [20]:

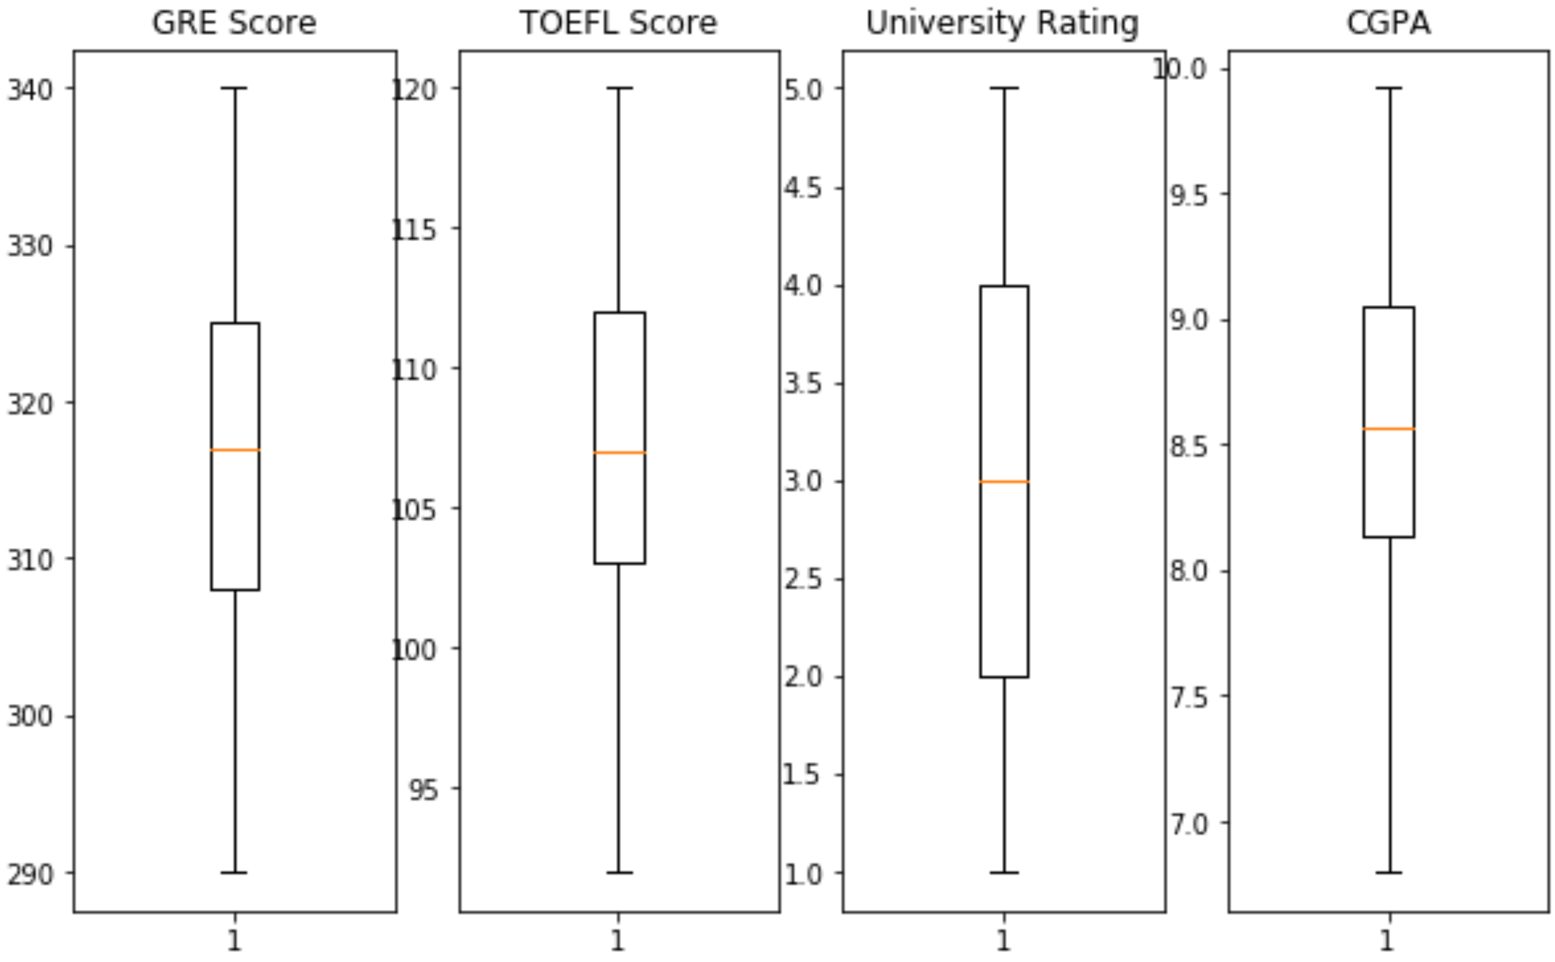
```
plt.figure(1, figsize=(10,6))
plt.subplot(1,4, 1)
plt.boxplot(merged['GRE_Score'])
plt.title('GRE Score')

plt.subplot(1,4,2)
plt.boxplot(merged['TOEFL_Score'])
plt.title('TOEFL Score')

plt.subplot(1,4,3)
plt.boxplot(merged['University_Rating'])
plt.title('University Rating')

plt.subplot(1,4,4)
plt.boxplot(merged['CGPA'])
plt.title('CGPA')

plt.show()
```



What scores should student get if they want to have an admission chance higher than 0.75?

In [21]:

```
merged_sort=merged.sort_values(by=merged.columns[7],ascending=False)
merged_sort.head()
```

Out[21]:

	GRE_Score	TOEFL_Score	University_Rating	SOP	LOR	CGPA	Research	Chance_of_Adr
Serial No.								
204	334	120	5	4.0	5.0	9.87	1	0.
144	340	120	4	4.5	4.0	9.92	1	0.
144	340	120	4	4.5	4.0	9.92	1	0.
25	336	119	5	4.0	3.5	9.80	1	0.
25	336	119	5	4.0	3.5	9.80	1	0.

In [22]:

```
merged_sort[(merged_sort['Chance_of_Admit']>0.75)].mean().reset_index()
```

Out[22]:

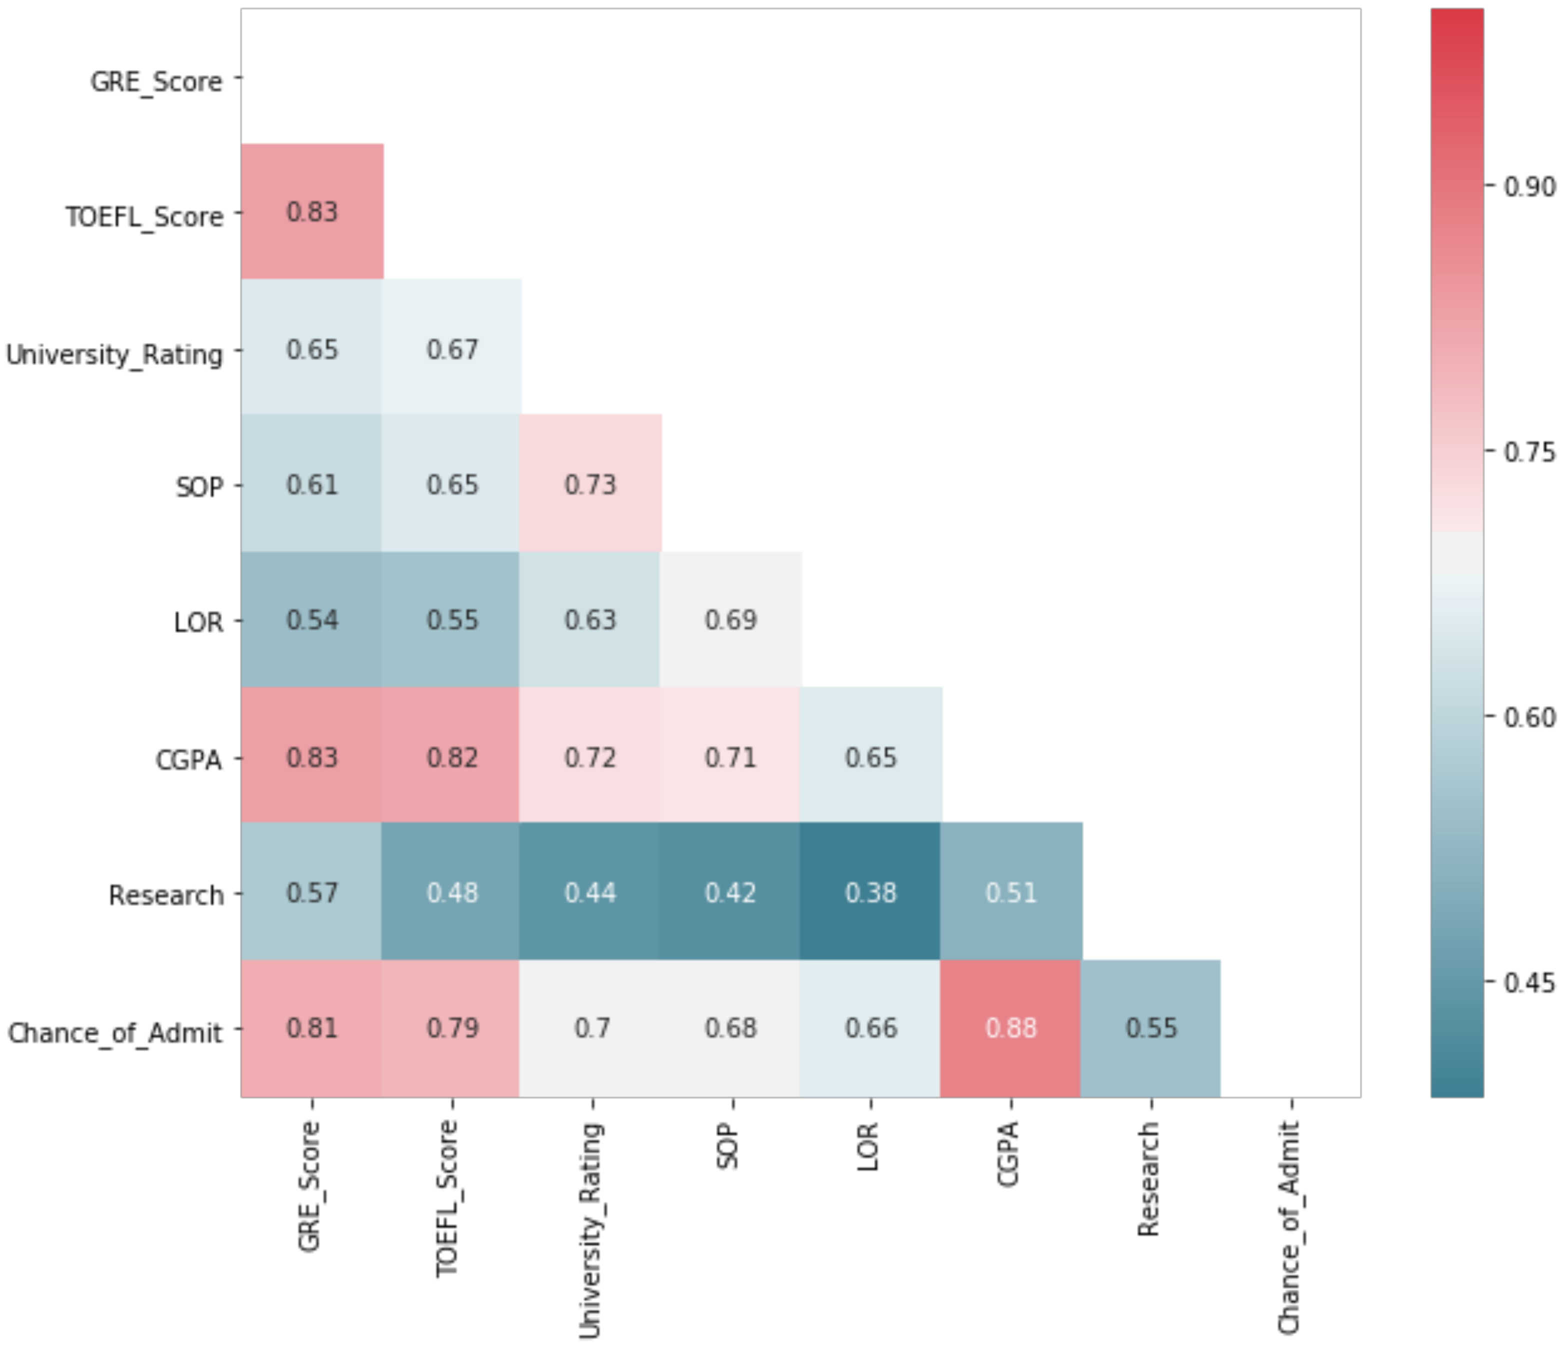
	index	0
0	GRE_Score	325.884817
1	TOEFL_Score	112.073298
2	University_Rating	3.950262
3	SOP	4.102094
4	LOR	4.061518
5	CGPA	9.114136
6	Research	0.848168
7	Chance_of_Admit	0.854607
8	Admit	1.000000

Assuming students with 0.75 chance of admission have secured admission. To have a 75% Chance to get admission, student should have at least a GRE score of 326, TOEFL score of 112, CGPA of 9.11. Students with scores more than this line have greater chance to get admission.

Correlation between All Columns

In [23]:

```
corr_matrix = numerical_data.corr()
plt.figure(figsize = (10,8))
cmap = sns.diverging_palette(220, 10, as_cmap=True)
mask = np.zeros_like(corr_matrix, dtype=np.bool)
mask[np.triu_indices_from(mask)] = True
sns.heatmap(corr_matrix,cmap=cmap,annot=True,mask=mask);
```



The 3 most important features for admission to the Master: CGPA, GRE SCORE, and TOEFL SCORE
The 3 least important features for admission to the Master: Research, LOR, and SOP

How important is Research to get an Admission?

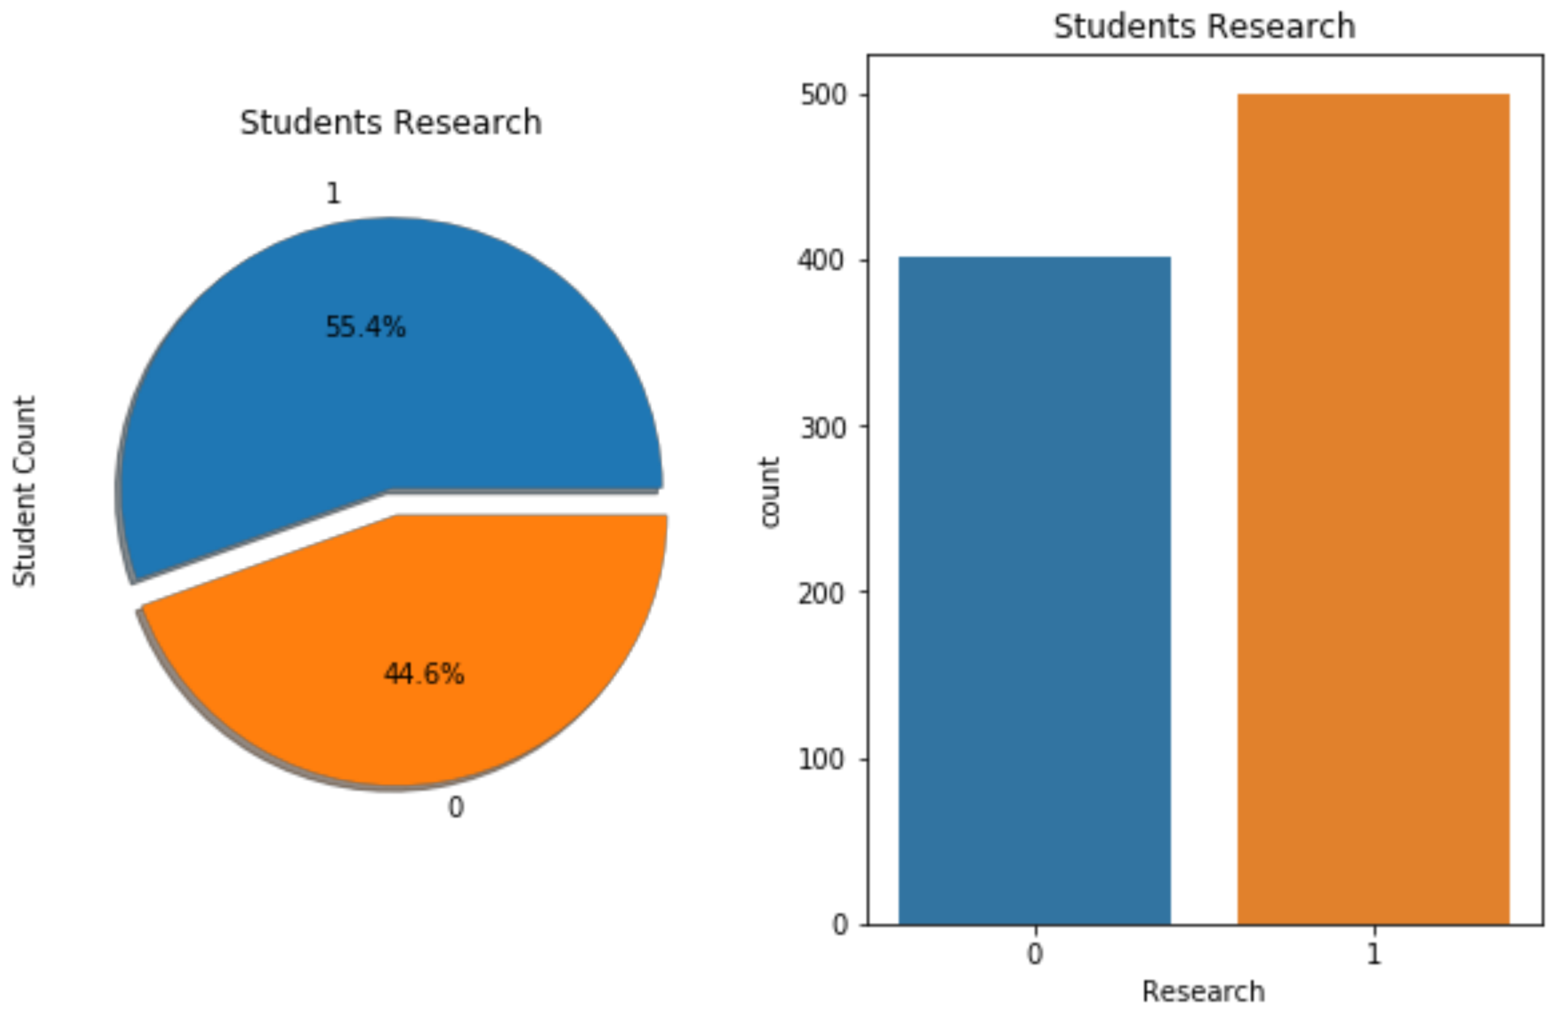
In [24]:

```
a=len(merged[merged.Research==1])
b=len(merged[merged.Research==0])
print('Total number of students',a+b)
print('Students having Research:',len(merged[merged.Research==1]))
print('Students not having Research:',len(merged[merged.Research==0]))
```

```
Total number of students 900
Students having Research: 499
Students not having Research: 401
```

In [25]:

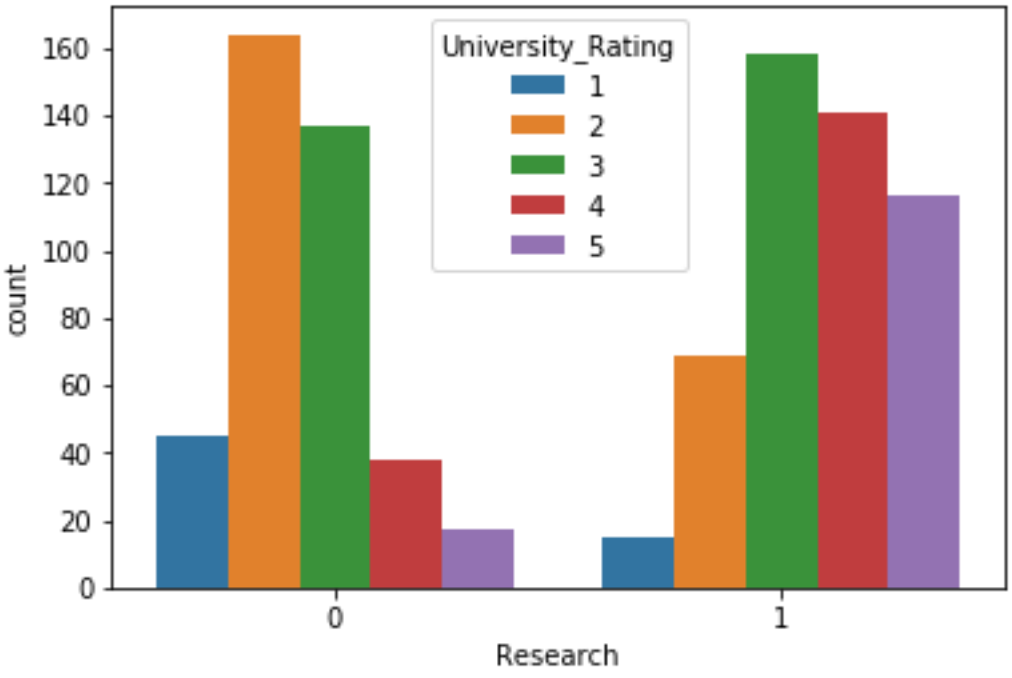
```
f,ax=plt.subplots(1,2,figsize=(10,6))
merged['Research'].value_counts().plot.pie(explode=[0,0.1],autopct='%1.1f%%',ax=ax[
ax[0].set_title('Students Research')
ax[0].set_ylabel('Student Count')
sns.countplot('Research',data=merged,ax=ax[1])
ax[1].set_title('Students Research')
plt.show()
```



Around 60% Students have research experience.

In [26]:

```
sns.countplot(x='Research', hue='University_Rating', data=merged)
plt.show()
```



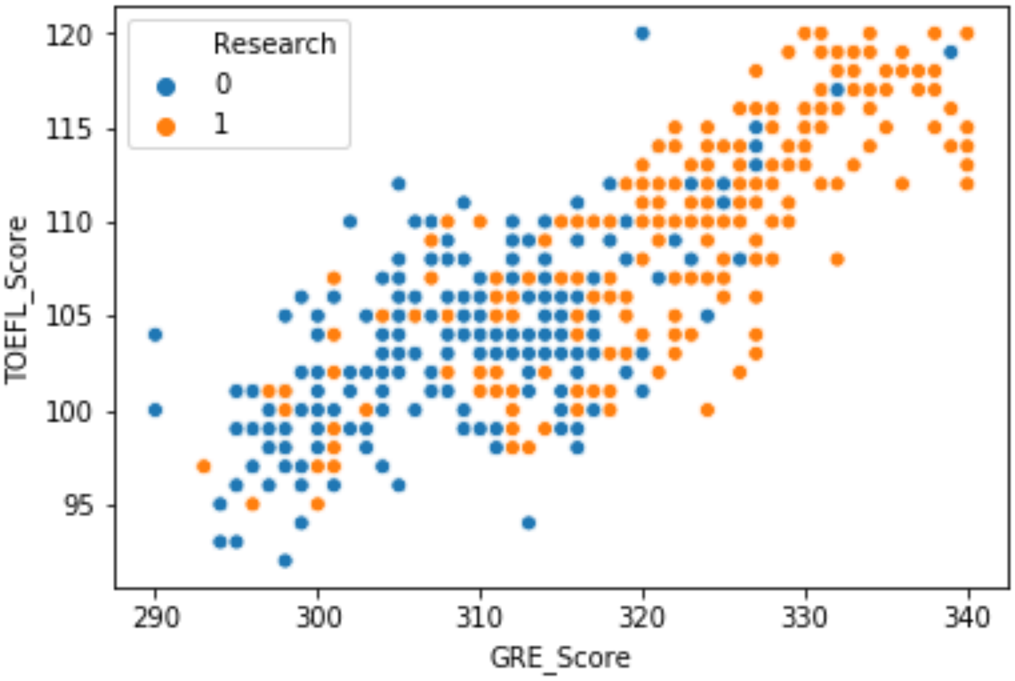
Students come from university with higher ratings tend to be more possible of having research experience.

In [27]:

```
sns.scatterplot(data=merged,x='GRE_Score',y='TOEFL_Score',hue='Research')
```

Out[27]:

```
<matplotlib.axes._subplots.AxesSubplot at 0x1a2244f5f8>
```



Students with research experience have good GRE scores and TOEFL scores.

Count the percentage of students, in each admission chance level, having research experience.

In [28]:

```
groupbyed = merged.groupby('Admit_Chance_Level')
groupbyed['Research'].value_counts(normalize=True) * 100
```

Out[28]:

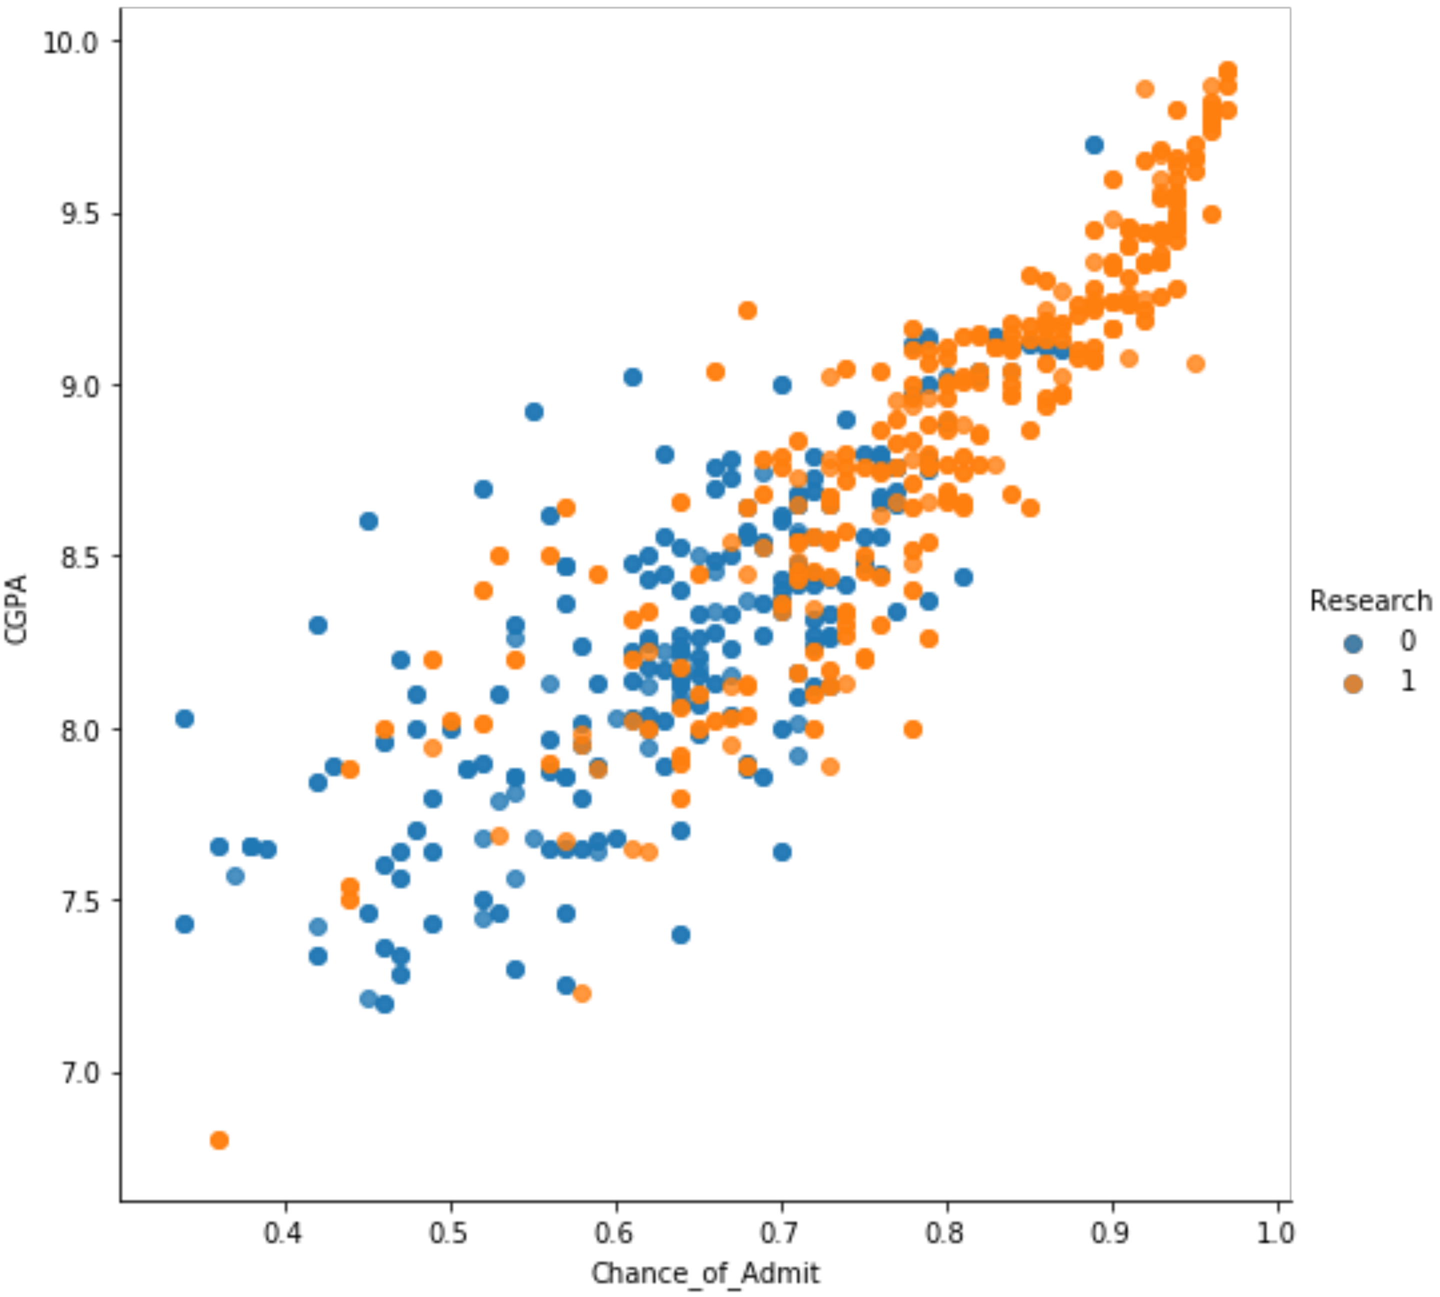
```
Admit_Chance_Level  Research
High                1           100.000000
Low                 0            77.976190
                    1            22.023810
Medium              1            54.166667
                    0            45.833333
Medium High         1            87.179487
                    0            12.820513
Medium Low          0            69.729730
                    1            30.270270
Name: Research, dtype: float64
```

Percentage of students having research experience goes higher as admission chance level increases.

Understanding the relation between different factors responsible for graduate admissions

```
In [29]:
```

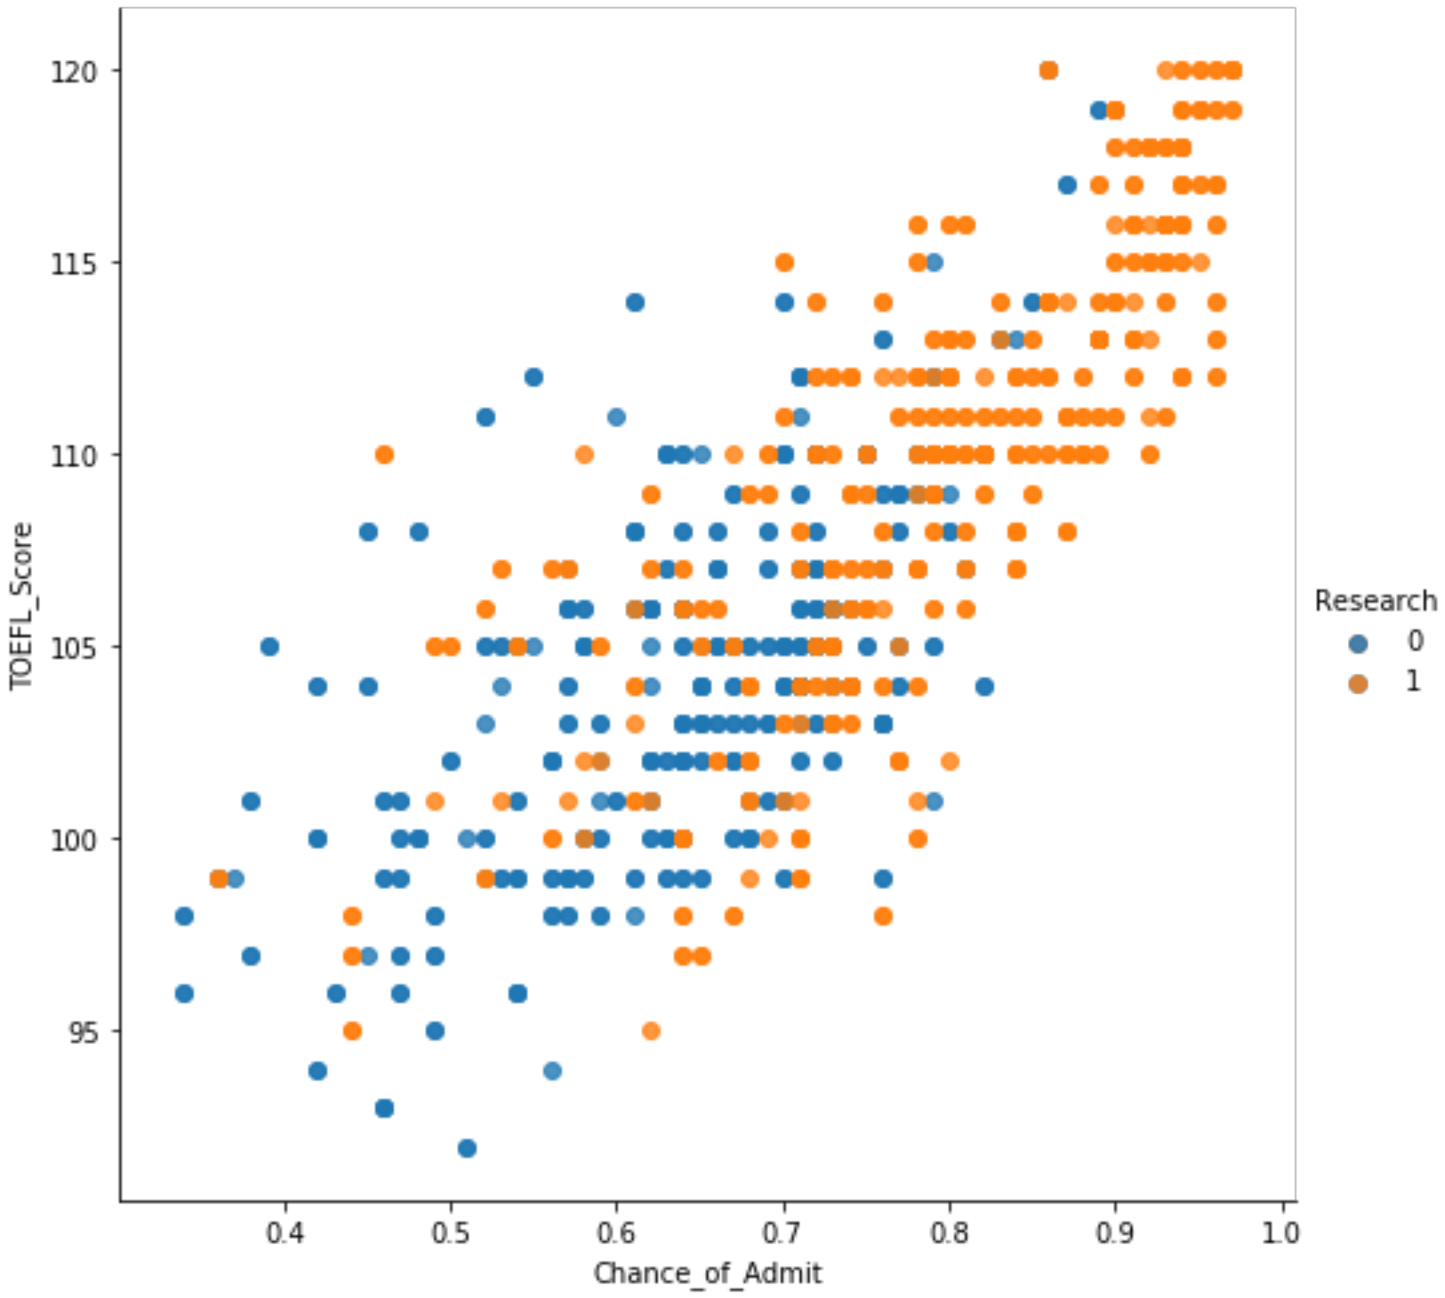
```
sns.lmplot('Chance_of_Admit', 'CGPA', data=numerical_data, hue='Research', fit_reg=
```



Highest Admission Based on CGPA in Between 8.5 to 9.0, with nearly all students having research experience.

In [30]:

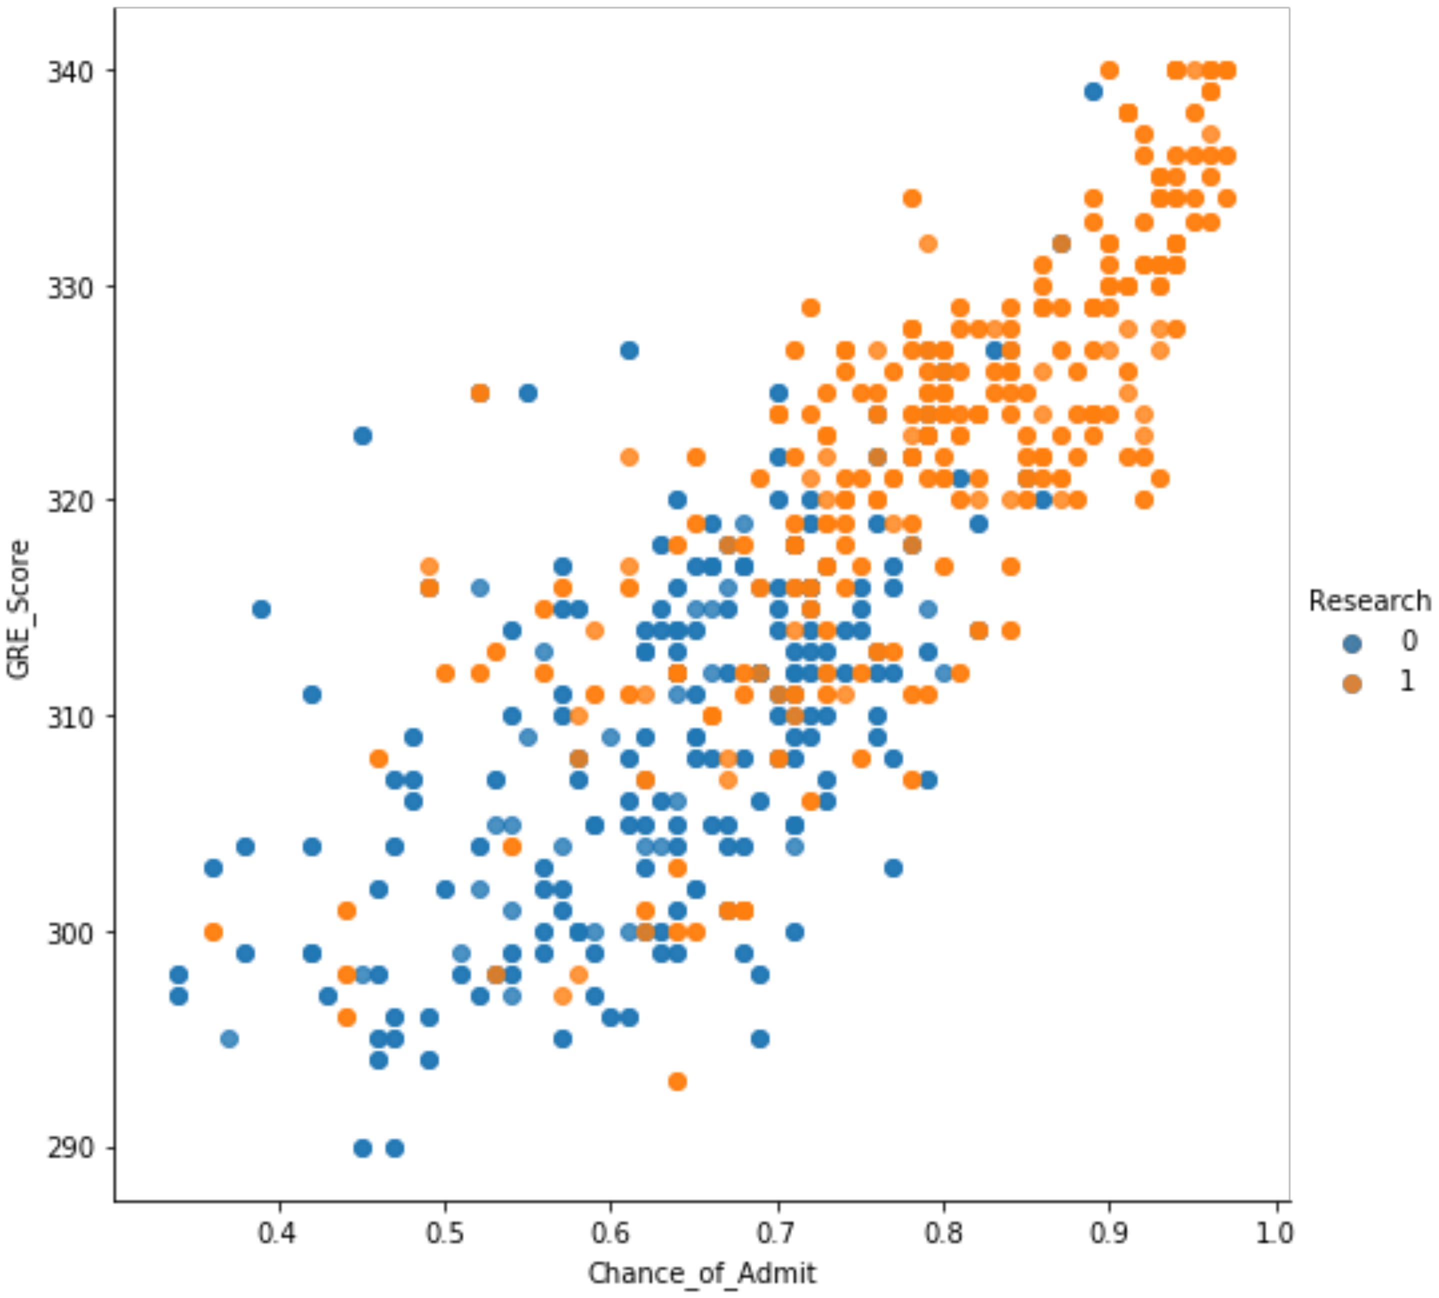
```
sns.lmplot('Chance_of_Admit','TOEFL_Score', data=numerical_data, hue='Research', fit
```



TOEFL Score mostly range from 100 to 120. Student with highest admission rate usually score from 115 to 120.

In [31]:

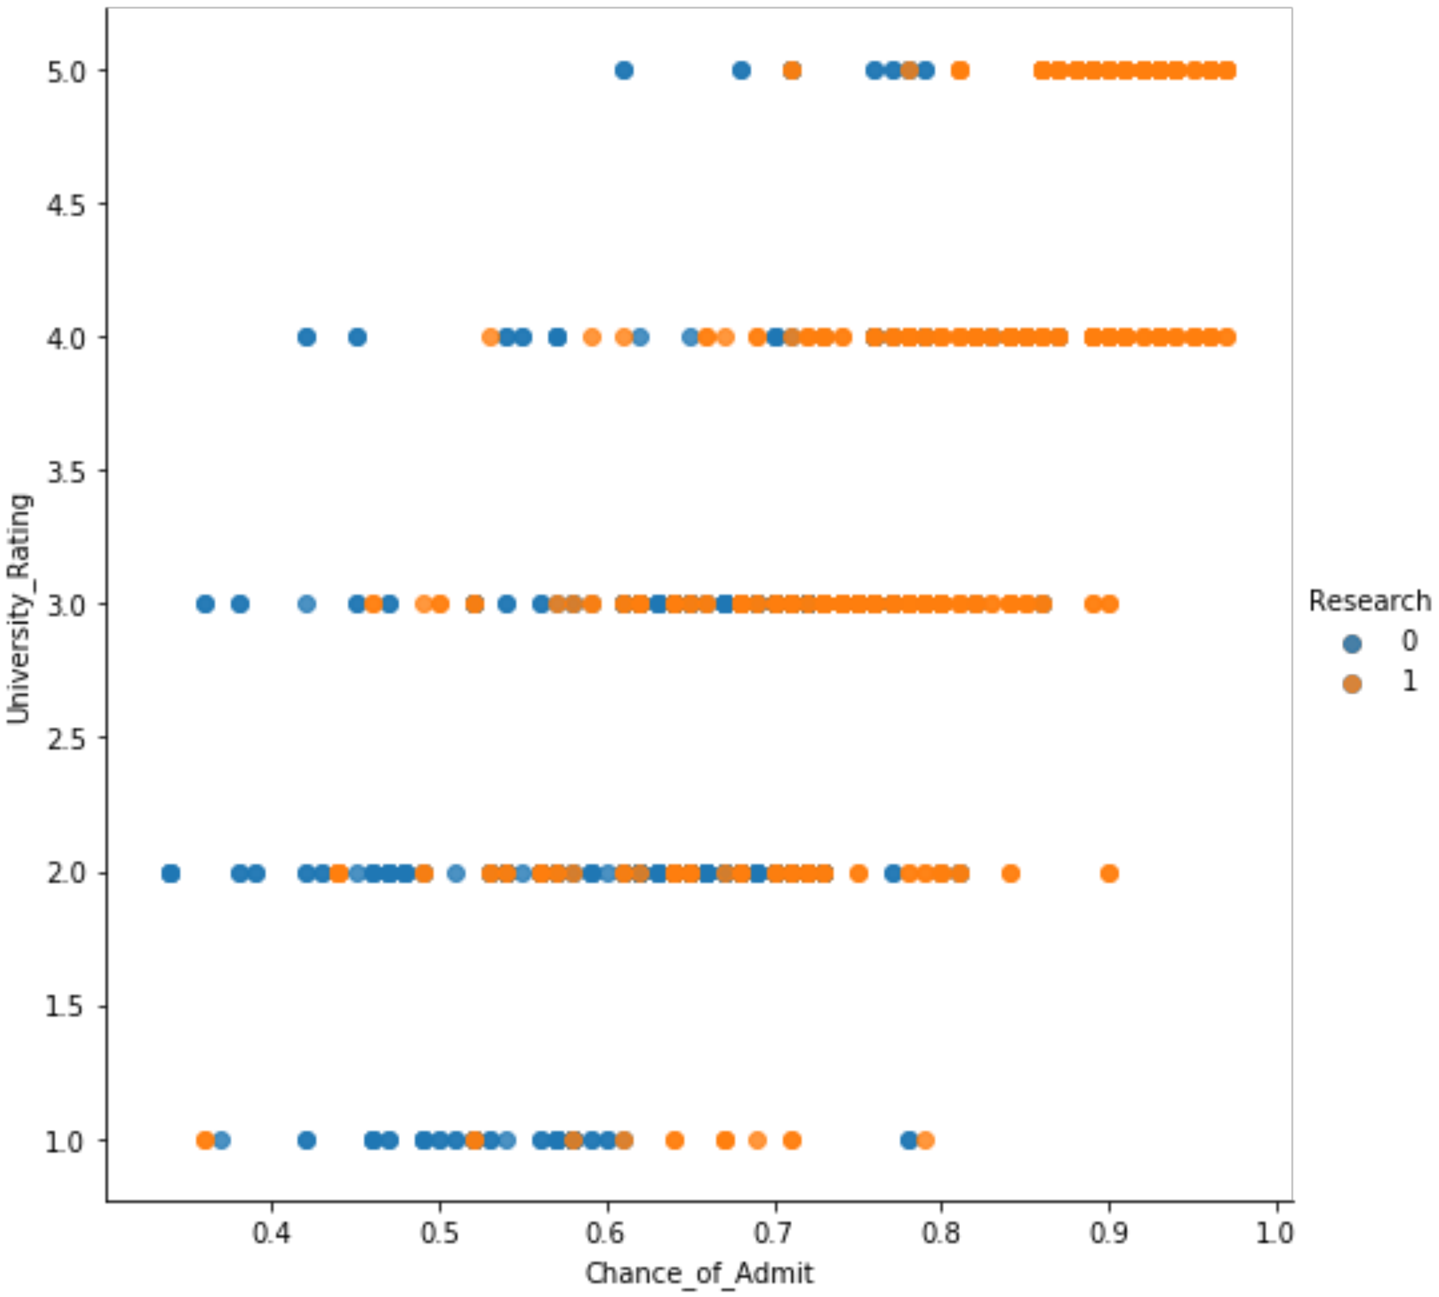
```
sns.lmplot('Chance_of_Admit','GRE_Score', data=numerical_data, hue='Research', fit_r
```



Clutser of GRE Score is Belong to 300 to 330. Students score above 330 have an possibility of admission higher than 0.9. Again, the higher the admission rate, the higher chance students would have research experience.

In [32]:

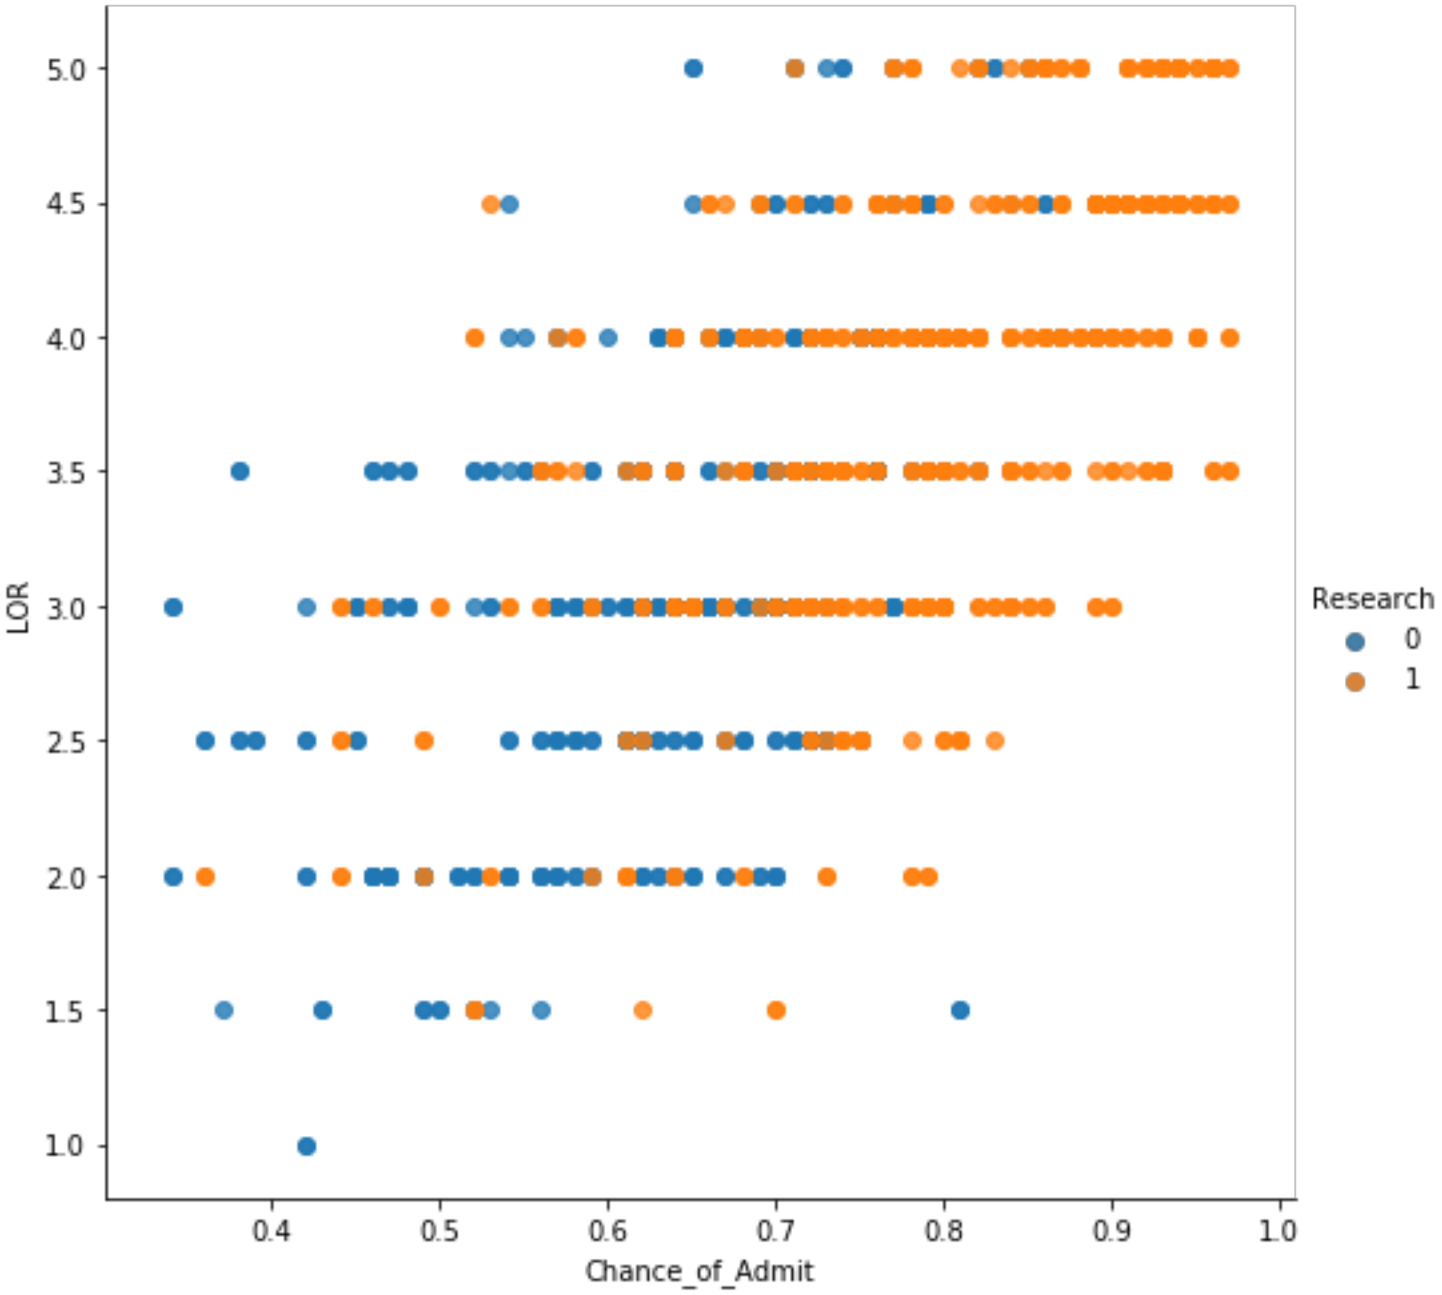
```
sns.lmplot('Chance_of_Admit','University_Rating', data=numerical_data, hue='Research
```



Higer university rating candidates would have a slightly higher chances of admit.

In [33]:

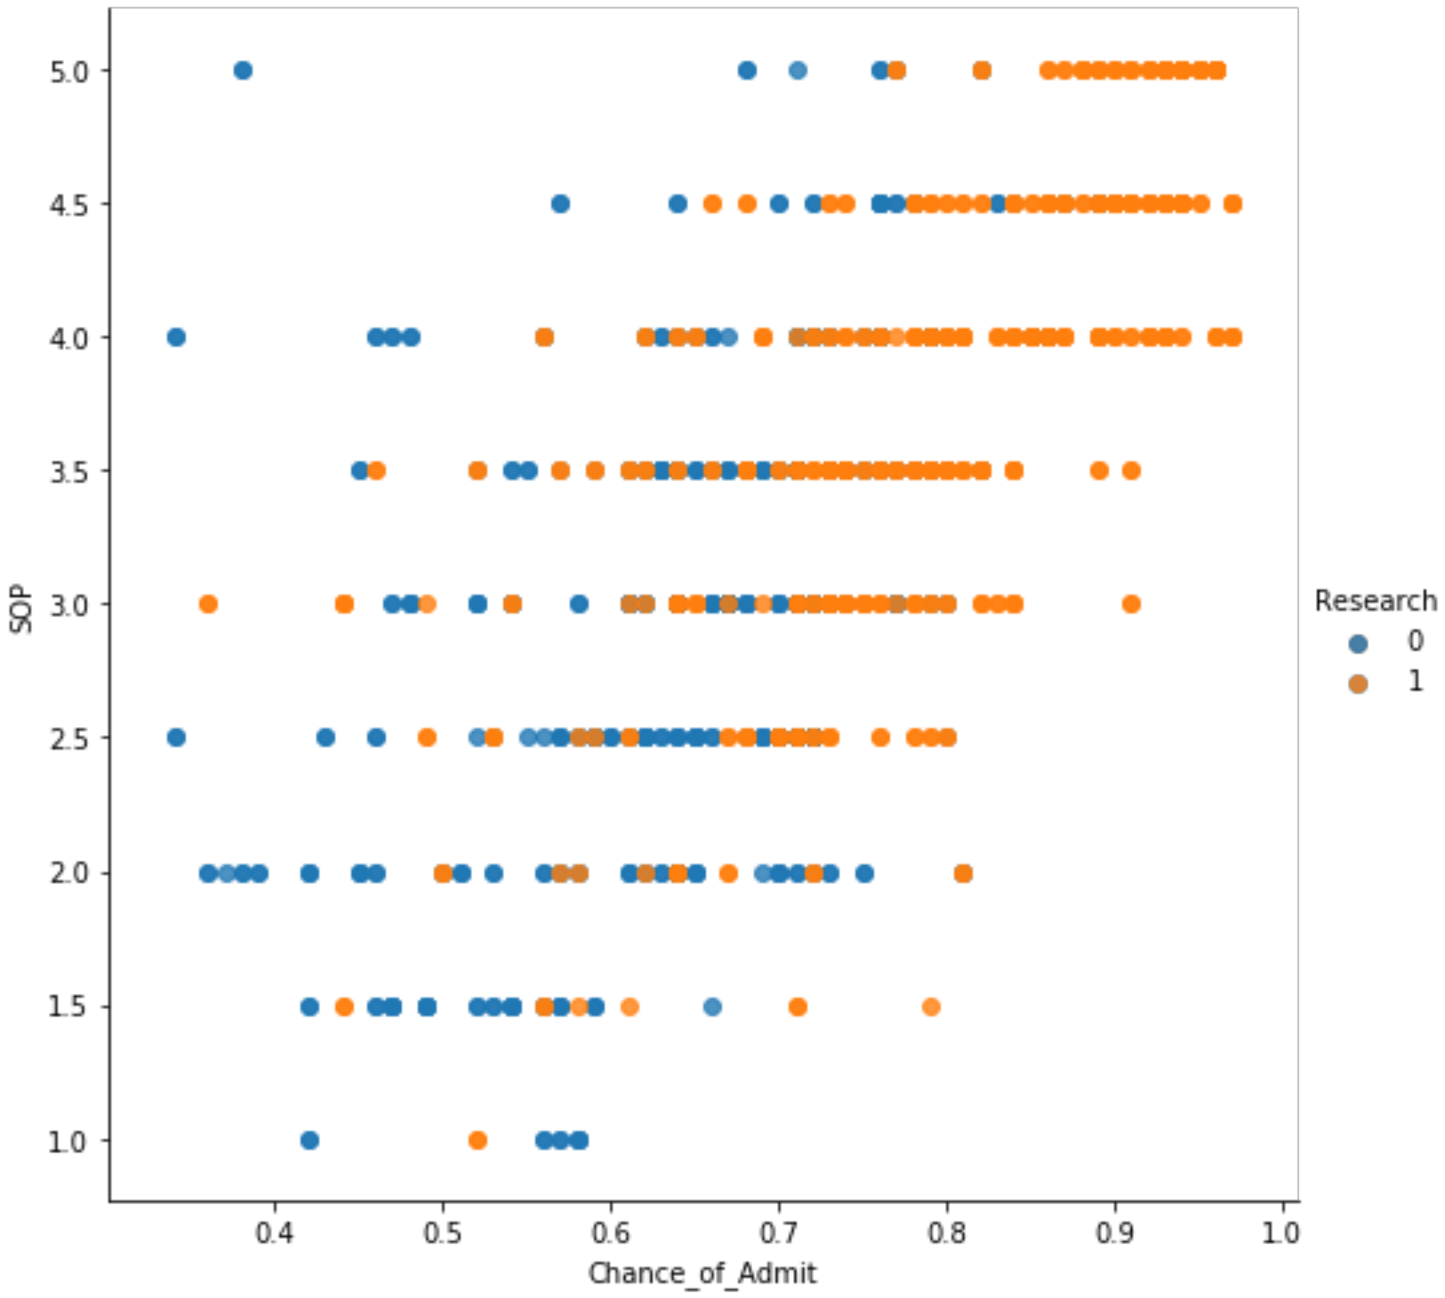
```
sns.lmplot('Chance_of_Admit','LOR', data=numerical_data, hue='Research', fit_reg=Fa
```



Higer level LOR candidates would have a higher chances of admit.

In [34]:

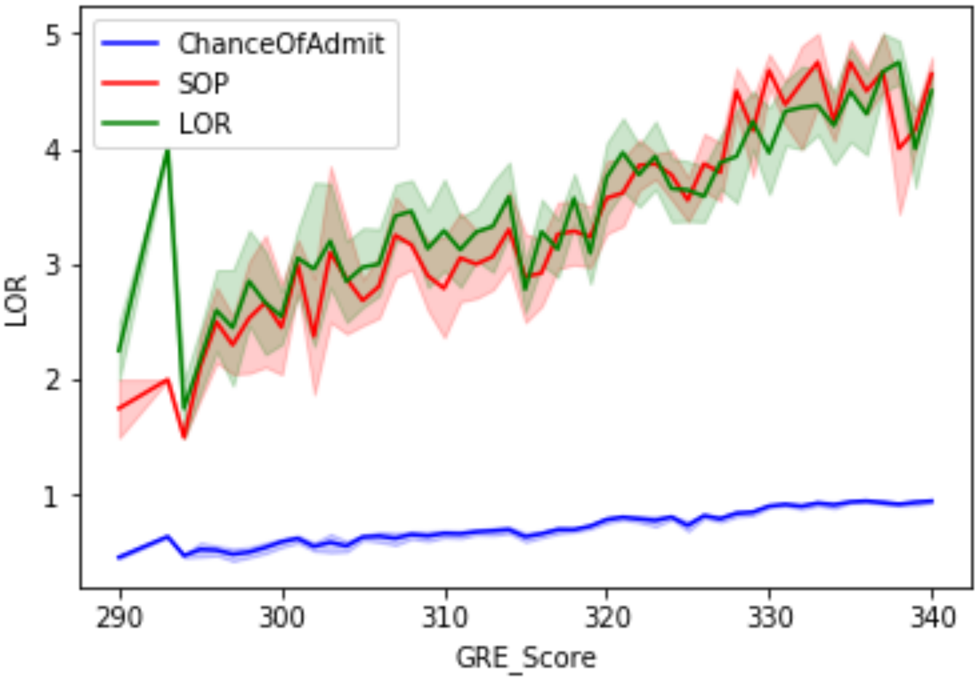
```
sns.lmplot('Chance_of_Admit','SOP', data=numerical_data, hue='Research', fit_reg=Fa
```



Higer level SOP candidates would have a higher chances of admit.

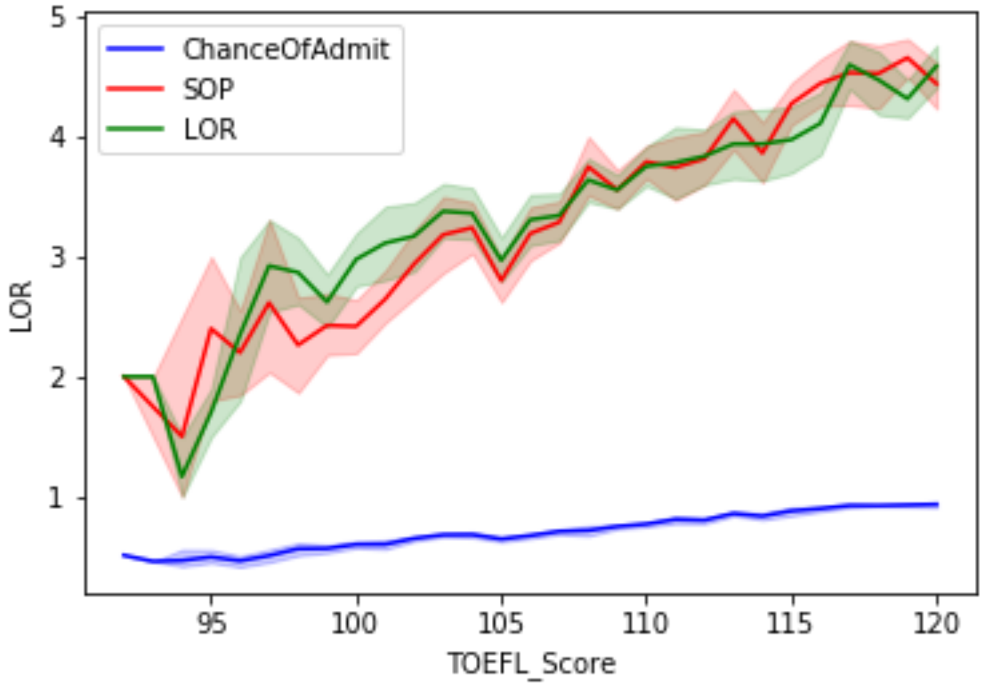
In [35]:

```
sns.lineplot(x="GRE_Score", y="Chance_of_Admit",
             data=numerical_data,color='b',label='ChanceOfAdmit')
sns.lineplot(x="GRE_Score", y="SOP",
             data=numerical_data,color='r',label='SOP')
sns.lineplot(x="GRE_Score", y="LOR",
             data=numerical_data,color='G',label='LOR')
plt.legend(loc=2)
plt.show()
```



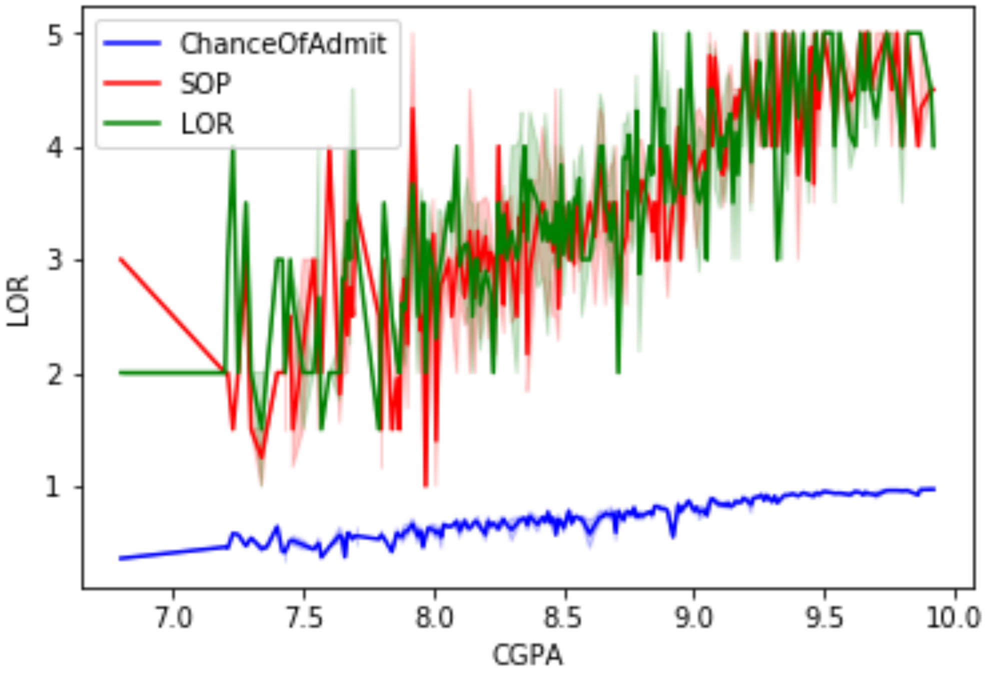
In [36]:

```
sns.lineplot(x="TOEFL_Score", y="Chance_of_Admit",
             data=numerical_data,color='b',label='ChanceOfAdmit')
sns.lineplot(x="TOEFL_Score", y="SOP",
             data=numerical_data,color='r',label='SOP')
sns.lineplot(x="TOEFL_Score", y="LOR",
             data=numerical_data,color='G',label='LOR')
plt.legend(loc=2)
plt.show()
```



In [37]:

```
sns.lineplot(x="CGPA", y="Chance_of_Admit",
             data=numerical_data,color='b',label='ChanceOfAdmit')
sns.lineplot(x="CGPA", y="SOP",
             data=numerical_data,color='r',label='SOP')
sns.lineplot(x="CGPA", y="LOR",
             data=numerical_data,color='G',label='LOR')
plt.legend(loc=2)
plt.show()
```



From the data exploration and visualization above, we can see that student's GRE score, TOEFL score, and CGPA having more significant impact on whether they can be admitted or not; while university rating, statement of purpose, letter of recommendation show a weaker influence. Finally, students with higher admission rate usually have research experience. That is to say, research experience, though shows a relatively low correlation, weighs a lot in the admission process.

5. Regression Analysis

train_test_split:

It splits the data into random train (80%) and test (20%) subsets.

In [38]:

```
numerical_data = numerical_data.reset_index()

target = 'Chance_of_Admit'
IDcol = 'Serial No.'
x_columns = [x for x in numerical_data .columns if x not in [target, IDcol]]
X = numerical_data[x_columns]
y = numerical_data['Chance_of_Admit']
```

In [39]:

```
from sklearn.metrics import r2_score
from sklearn.model_selection import train_test_split
X_train, X_test, y_train, y_test = train_test_split(X,y,test_size=0.2)
```

Note about r2_score:

We will use R-squared score to compare the accuracy for each regression model as it represents how close the data are to the fitted regression line. That is to say, the higher the R-squared, the better the model fits the data and makes better predictions.The best possible score is 1.0 for r2_score.

5.1 Linear Regression Model

In [40]:

```
from sklearn.linear_model import LinearRegression
lr = LinearRegression().fit(X_train,y_train)
```

In [41]:

```
y_pred_lr = lr.predict(X_test)
r2_score_lr = r2_score(y_test,y_pred_lr)
r2_score_lr
```

Out[41]:

```
0.804590919255666
```

5.2 DecisionTree Regression Model

In [42]:

```
from sklearn.tree import DecisionTreeRegressor
dt = DecisionTreeRegressor().fit(X_train,y_train)
```

In [43]:

```
y_pred_dt = dt.predict(X_test)
r2_score_dt = r2_score(y_test,y_pred_dt)
r2_score_dt
```

Out[43]:

```
0.9375056949439617
```

5.3 Random Forest Regression Model

In [44]:

```
from sklearn.ensemble import RandomForestRegressor
rf = RandomForestRegressor()
from pprint import pprint
print('Parameters currently in use:\n')
pprint(rf.get_params())
```

```
Parameters currently in use:

{'bootstrap': True,
 'criterion': 'mse',
 'max_depth': None,
 'max_features': 'auto',
 'max_leaf_nodes': None,
 'min_impurity_decrease': 0.0,
 'min_impurity_split': None,
 'min_samples_leaf': 1,
 'min_samples_split': 2,
 'min_weight_fraction_leaf': 0.0,
 'n_estimators': 'warn',
 'n_jobs': None,
 'oob_score': False,
 'random_state': None,
 'verbose': 0,
 'warm_start': False}
```

Tuning the parameters of the model to get more accurate predictions.

In [45]:

```
from sklearn.model_selection import RandomizedSearchCV

# Number of features to consider at every split
max_features = ['auto', 'sqrt','log2']

```

The best model is Random Forest which has the highest R2 score (0.95)

6. Conclusion and Summary

In [74]:

```
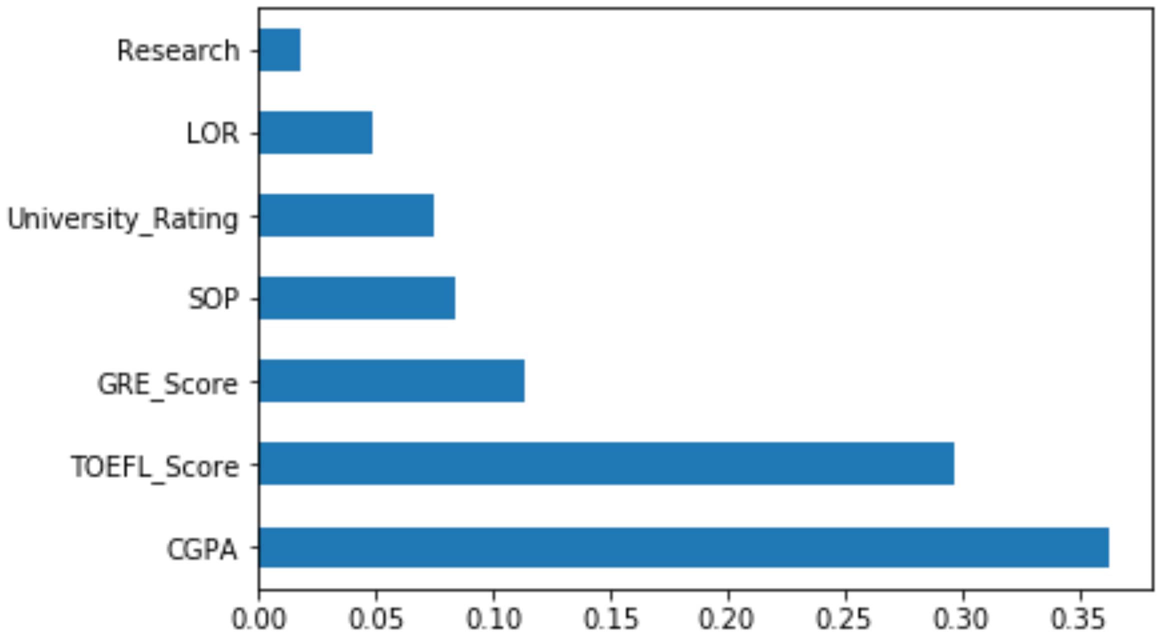
feature_importances = pd.Series(rf.feature_importances_, index=x_columns)
feature_importances.nlargest(7).plot(kind='barh')
```

Out[74]:

```
<matplotlib.axes._subplots.AxesSubplot at 0x1a22597e80>
```



Feature Selection is the process to select those features which contribute most to the prediction variable or output.It reduces overfitting, improves accuracy and reduces training time.

The importances of variables are presented above, and GPA is the most important parameter

CGPA: 0.36

GRE SCORE: 0.23

TOEFL SCORE: 0.14

UNIVERSITY RATING: 0.9

SOP: 0.07

LOR: 0.06

RESEARCH: 0.03

```
In [75]:
```

```
# Predicting the Rating values for testing data
PredAdmit = rf.predict(X_test)

# Creating a DataFrame of Testing data
AdmitData=pd.DataFrame(X_test, columns=x_columns)
AdmitData['ChancesOfAdmit']=y_test
AdmitData['PredictedChancesOfAdmit']=PredAdmit
AdmitData.head()
```

```
Out[75]:
```

	GRE_Score	TOEFL_Score	University_Rating	SOP	LOR	CGPA	Research	ChancesOfAdmit
71	320	110	5	5.0	4.5	9.22	1	0.92
439	312	106	3	4.0	3.5	8.79	1	0.81

# Calculating the Absolute Percentage Error committed in each prediction
AdmitData['APE']=100 * (abs(AdmitData['ChancesOfAdmit'] - AdmitData['PredictedChance
# Final accuracy of the model
print('Mean Absolute Percent Error(MAPE): ',round(np.mean(AdmitData['APE'])), '%')
print('Average Accuracy of the model: ',100 - round(np.mean(AdmitData['APE'])), '%'
```

```
Mean Absolute Percent Error(MAPE):  2 %
Average Accuracy of the model:  98 %
```

The most important parameter is CGPA
The model is 98% accurate to predict admission status of a candidate

Data Bootcamp Final Project

UCLA Graduate Admissions Dataset

Team: ***Yuyang Fu*, *Yangming Zhang***

Data Sources: Kaggle https://www.kaggle.com/mohansacharya/graduate-admissions (https://www.kaggle.com/mohansacharya/graduate-admissions)

Citation: Mohan S Acharya, Asfia Armaan, Aneeta S Antony : A Comparison of Regression Models for Prediction of Graduate Admissions, IEEE International Conference on Computational Intelligence in Data Science 2019

Table of Contents

1. Introduction

This project mainly focuses on what parameters are important for a student to get into UCLA graduate school, and how these factors are interrelated among themselves. It will also help predict candidates' chances of admission given the variables.

2. Data Import

In [1]:

In [2]:

In [3]:

Checking data types (which are int64 and float64)

In [4]:

Out[4]:

```
Serial No.             int64
GRE Score              int64
TOEFL Score            int64
University Rating      int64
SOP                  float64
LOR                  float64
CGPA                 float64
Research               int64
Chance of Admit      float64
dtype: object
```

The dataset contains several parameters which are considered important during the application for Masters Programs
The parameters included are :

1. GRE Scores (out of 340)
2. TOEFL Scores (out of 120)
3. University Rating (out of 5)
4. Statement of Purpose (out of 5)
5. Letter of Recommendation Strength (out of 5)
6. Undergraduate GPA (out of 10)
7. Research Experience (either 0 or 1)
8. Chance of Admit (ranging from 0 to 1)

3. Data Filtering and Cleaning

Checking if there are any null values in the dataset

In [5]:

Out[5]:

```
Serial No.           0
GRE Score            0

Returning a tuple representing the dimensionality of the dataframe

In [9]:

Out[9]:

```
(900, 9)
```

Grouping the chance of admit into 5 levels(which are HIGH, MEDIA HIGH, MEDIUM, MEDIUM LOW, LOW) by the interval of 0.1. The levels of the admit chance are more understanable and visualized, what's more, differentiating the data by the same interval makes it more convenient to compare with each group.

In [10]:

Assuming here that students with 0.7 chance of admission have secured admission. Therefore we create another column named Admit. The value of Admit=1 if Chance>0.7 and Admit=0 if Chance<0.7.

In [11]:

In [12]:

In [13]:

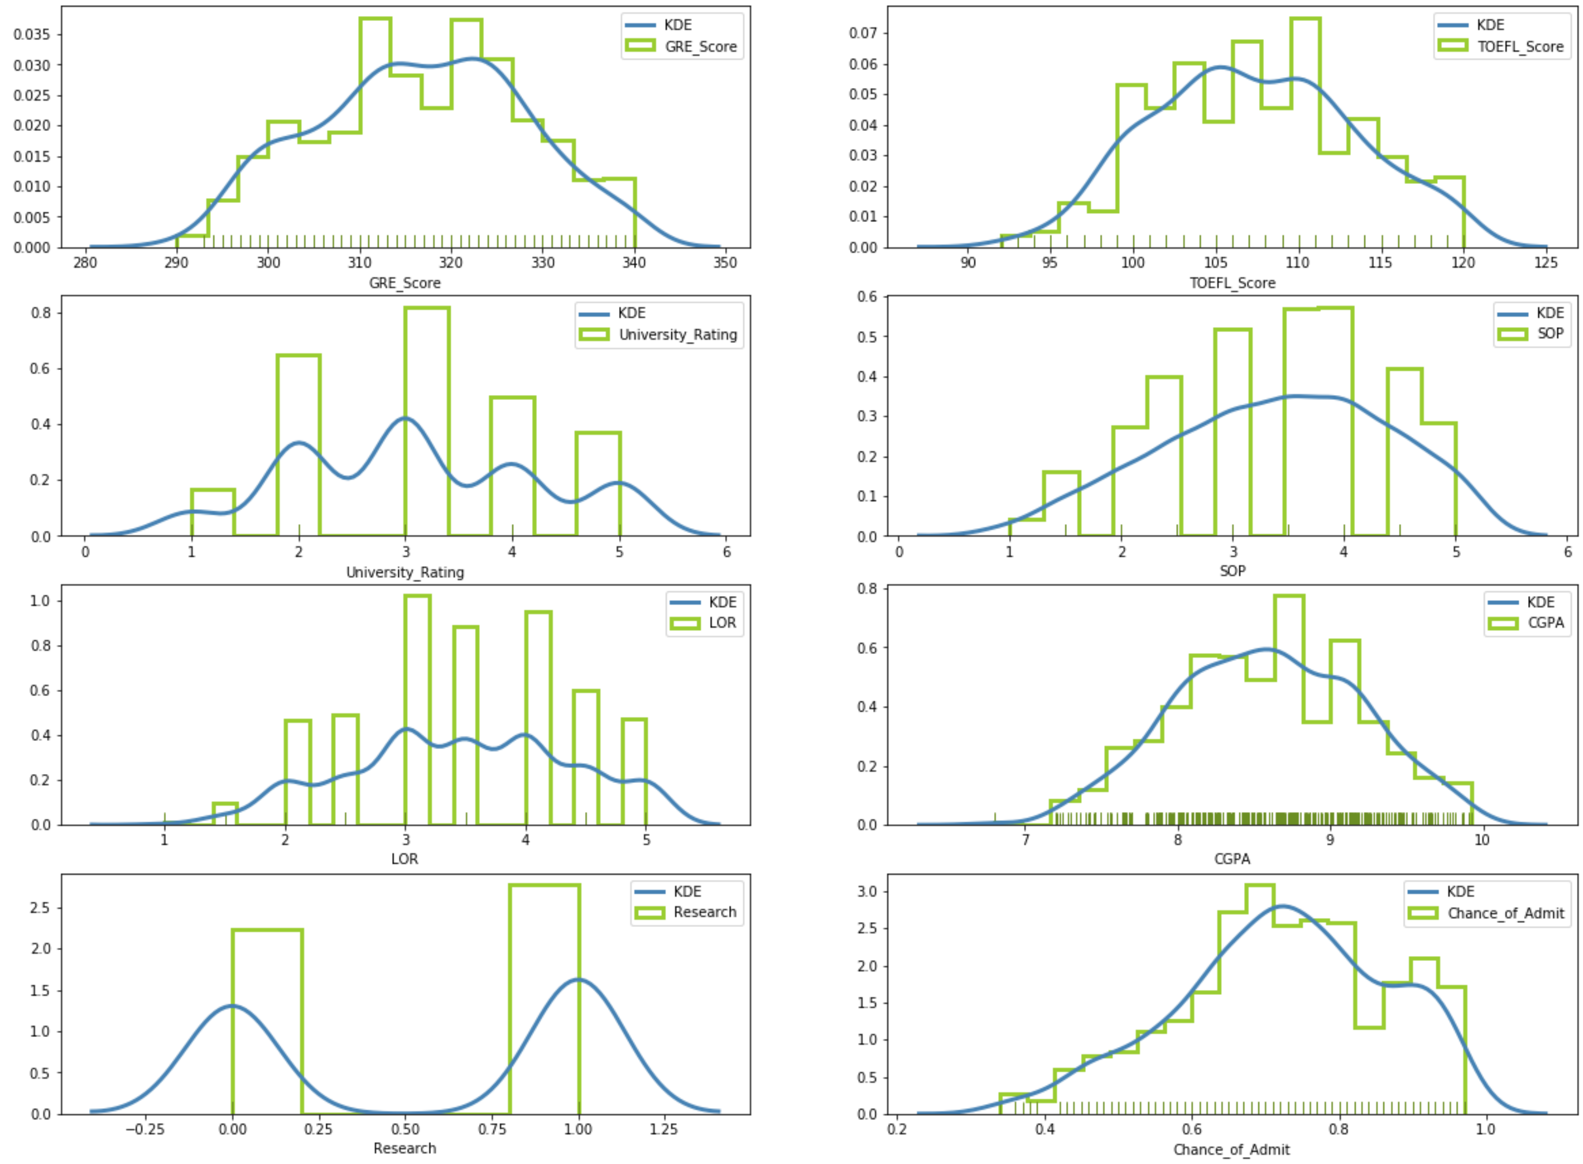
The distributions of different variables

```
In [18]:
```

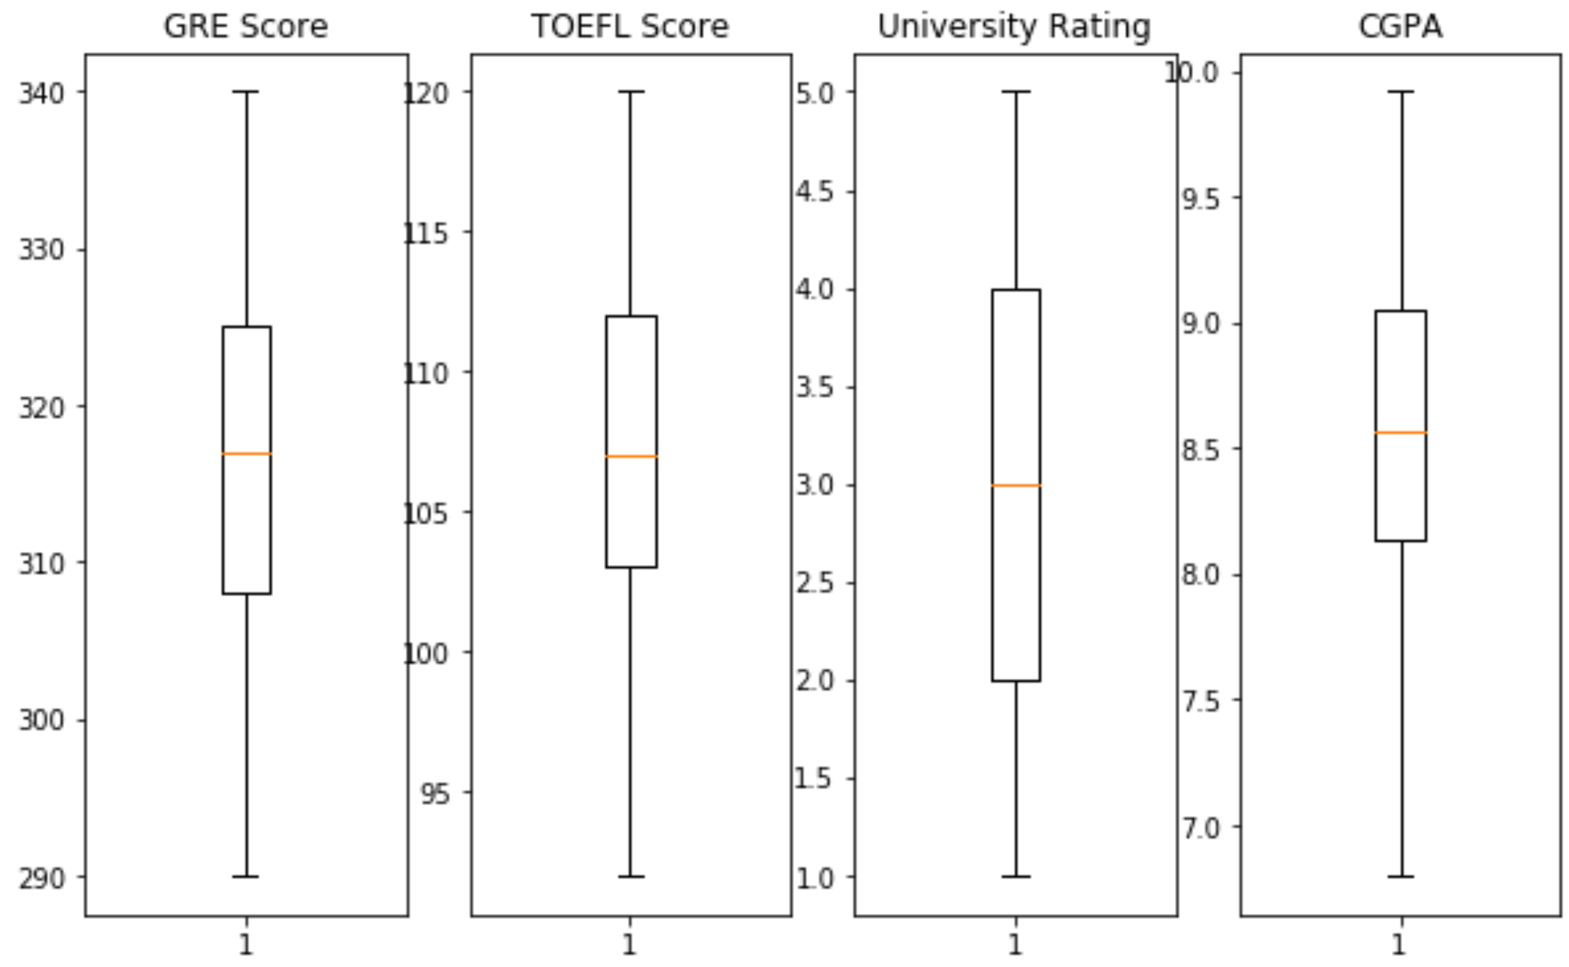
In [19]:



TOEFL Score: The density of TOEFL score are between 100 and 105.
GRE Score: There is a density between 310 and 330. Being above this range would be a good feature for a candidate to stand out.
University Rating: Most of candidates come from score 3 university, and the candidates of score 2,3,4 are about half of that of score 3.
Statement of Purpose: The SoPs are mainly distributed between 2.5 and 5.
LOR: For most of candidates, their letters of recommendation are between 3 and 4.
CGPA: The CGPA are mainly distributed between 8.0 to 9.5.

Min,median and max values for GRE,TOEFL,University rating and CGPA.

```
In [20]:
```



What scores should student get if they want to have an admission chance higher than 0.75?

```
In [21]:
```

```
Out[21]:
```

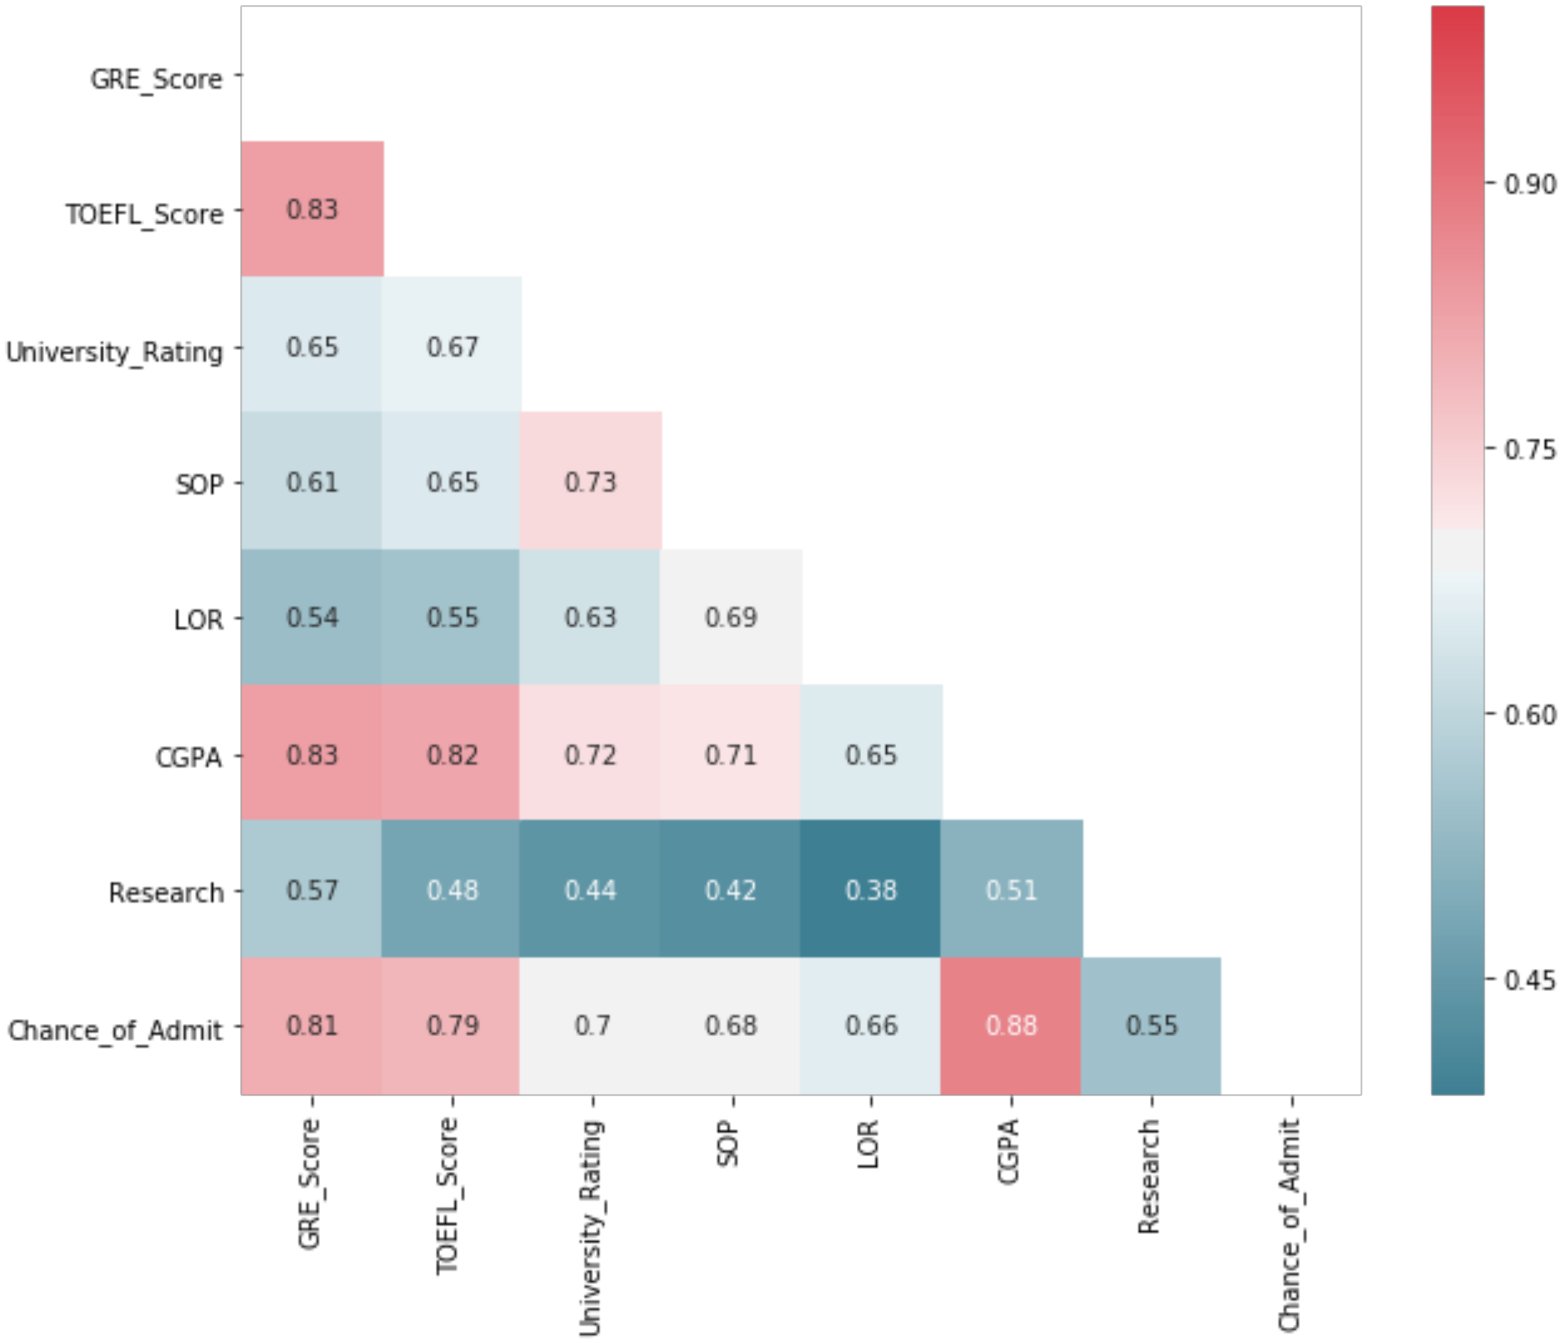
Assuming students with 0.75 chance of admission have secured admission. To have a 75% Chance to get admission, student should have at least a GRE score of 326, TOEFL score of 112, CGPA of 9.11. Students with scores more than this line have greater chance to get admission.

Correlation between All Columns

In [23]:



The 3 most important features for admission to the Master: CGPA, GRE SCORE, and TOEFL SCORE
The 3 least important features for admission to the Master: Research, LOR, and SOP

How important is Research to get an Admission?

In [24]:

```
Total number of students 900
Students having Research: 499
Students not having Research: 401
```

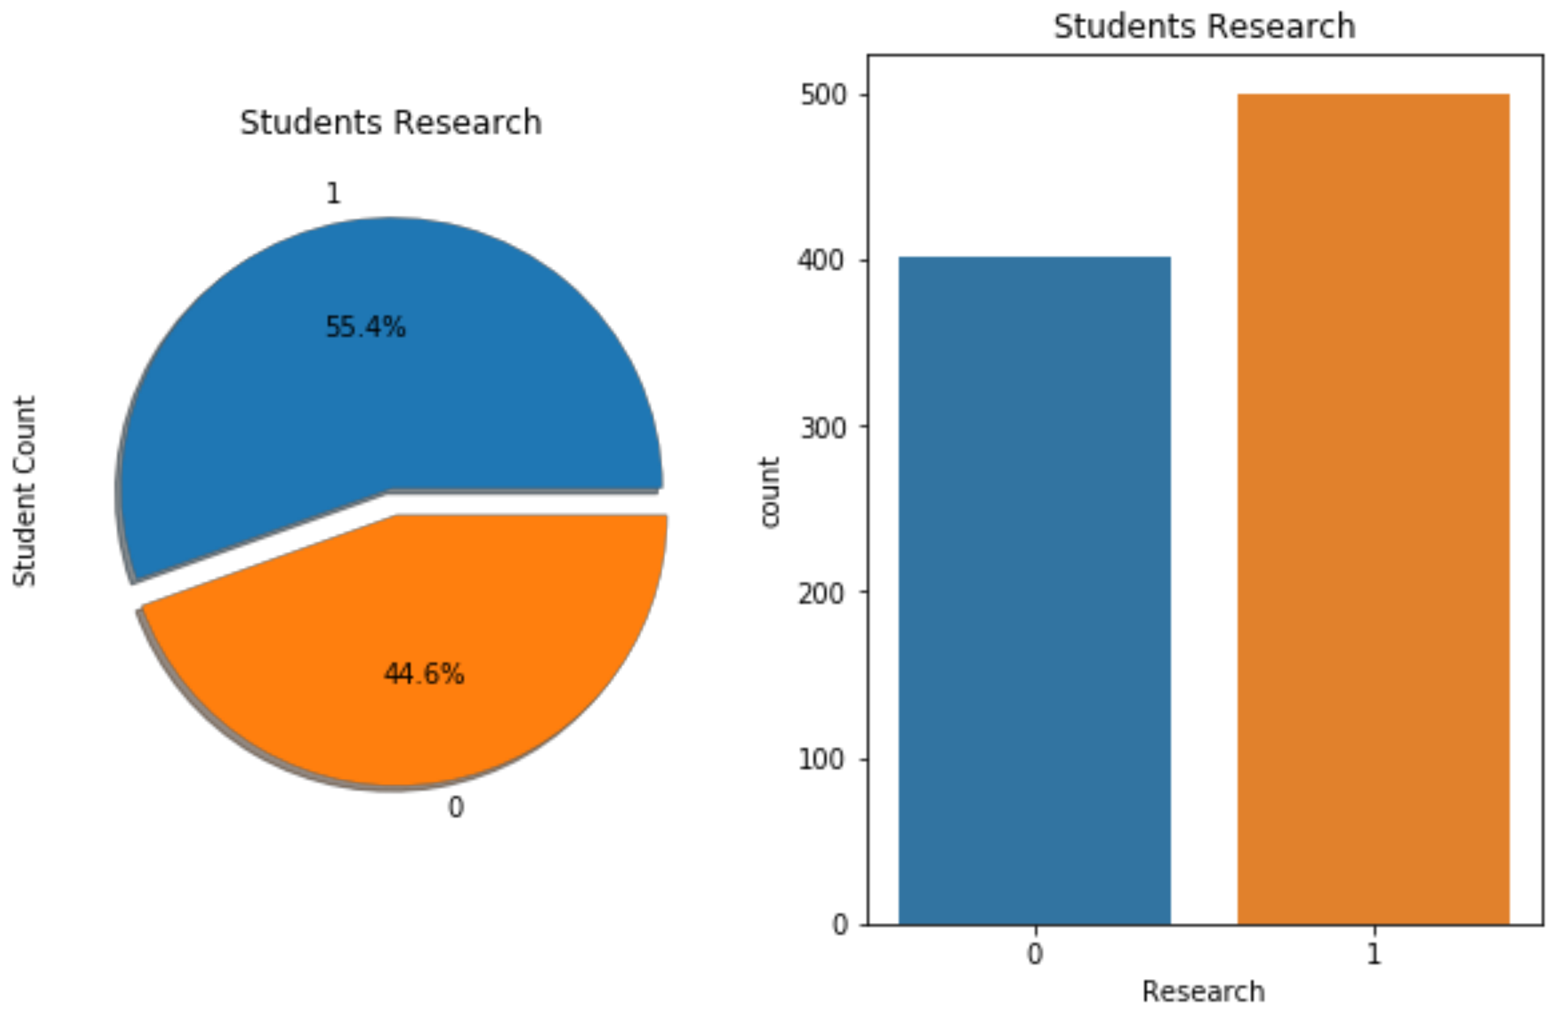
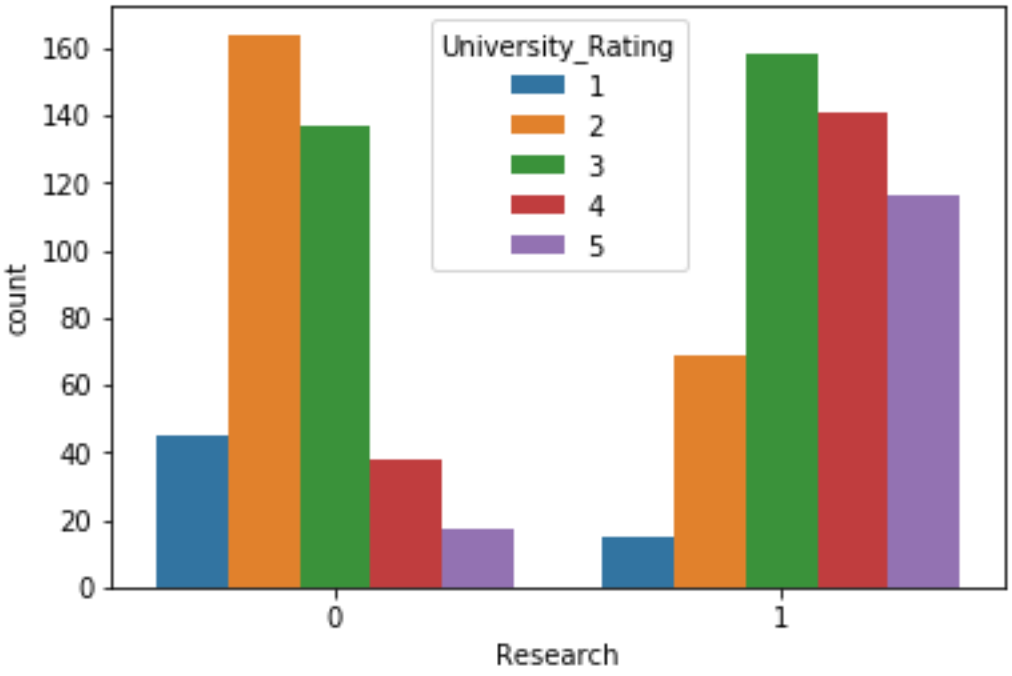
In [25]:



Around 60% Students have research experience.

In [26]:



Students come from university with higher ratings tend to be more possible of having research experience.

In [27]:

Out[27]:

```
<matplotlib.axes._subplots.AxesSubplot at 0x1a2244f5f8>
```

Students with research experience have good GRE scores and TOEFL scores.

Count the percentage of students, in each admission chance level, having research experience.

In [28]:

Out[28]:

```
Admit_Chance_Level  Research
High                1           100.000000
Low                 0            77.976190
                    1            22.023810
Medium              1            54.166667
                    0            45.833333
Medium High         1            87.179487
                    0            12.820513
Medium Low          0            69.729730
                    1            30.270270
Name: Research, dtype: float64
```

Percentage of students having research experience goes higher as admission chance level increases.

Understanding the relation between different factors responsible for graduate admissions

```
In [29]:
```

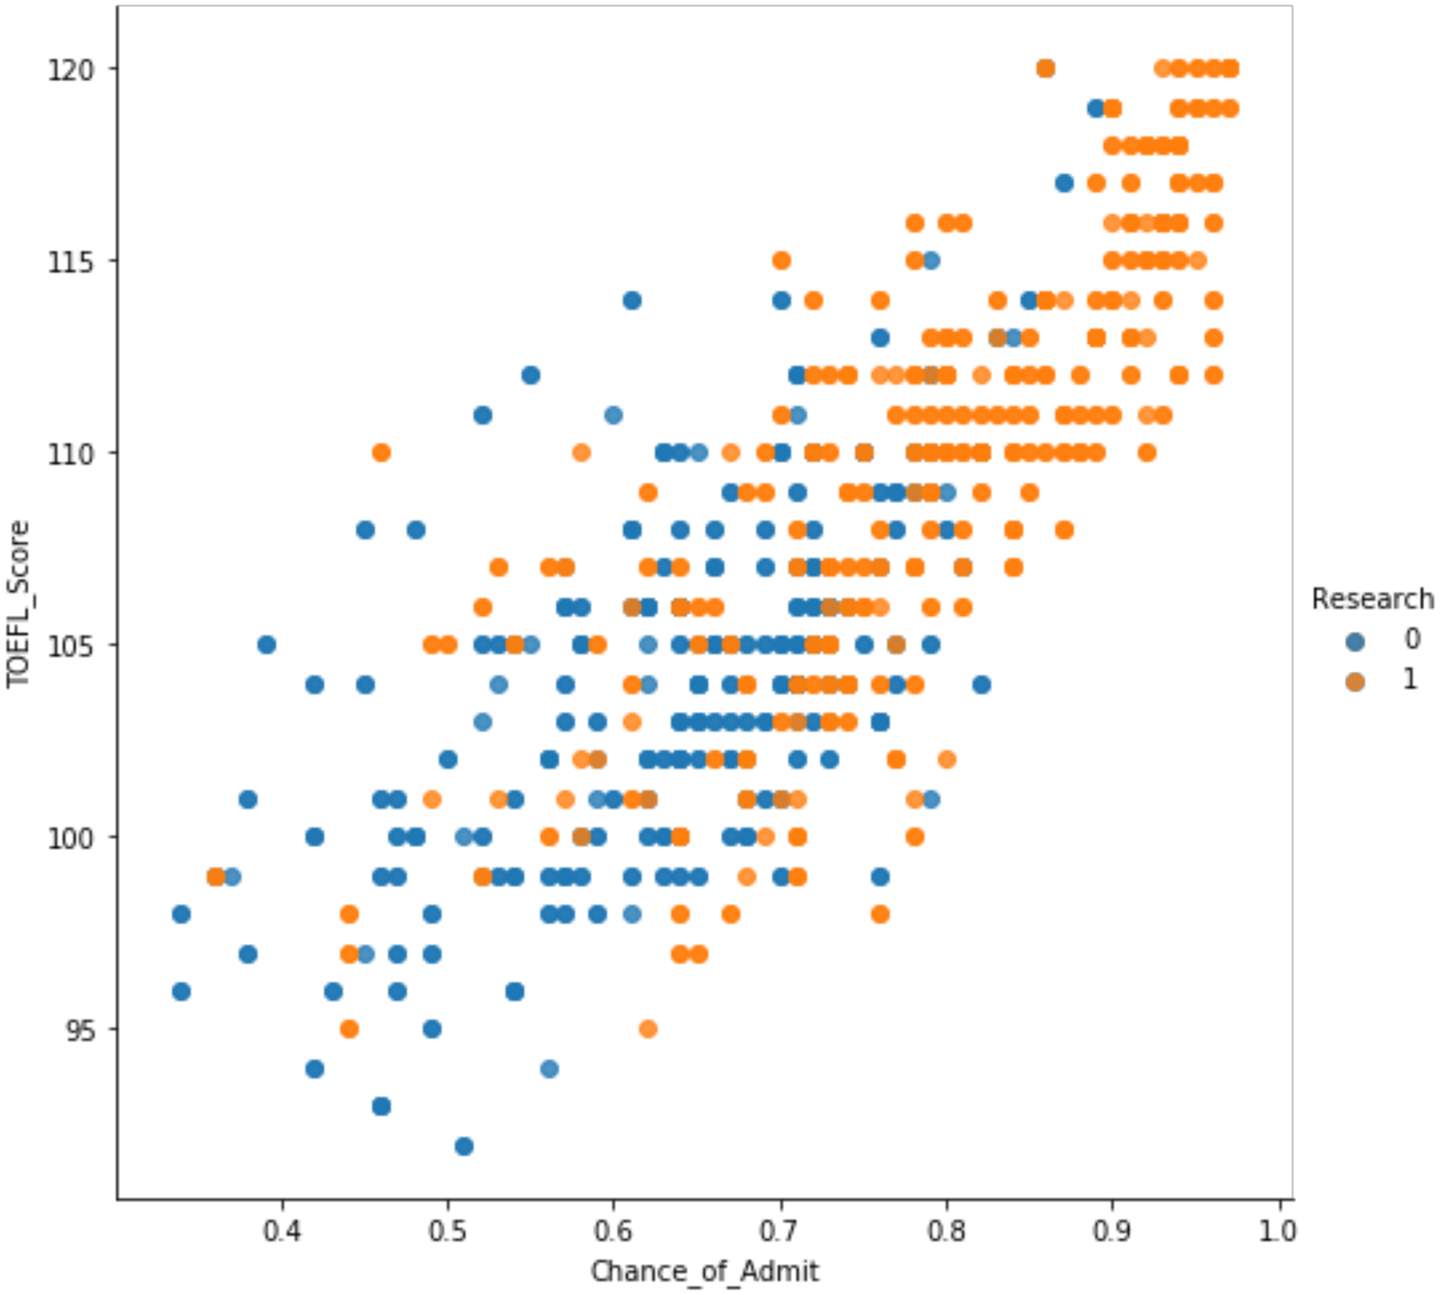
Highest Admission Based on CGPA in Between 8.5 to 9.0, with nearly all students having research experience.

In [30]:



TOEFL Score mostly range from 100 to 120. Student with highest admission rate usually score from 115 to 120.

```
In [31]:
```

Clutser of GRE Score is Belong to 300 to 330. Students score above 330 have an possibility of admission higher than 0.9. Again, the higher the admission rate, the higher chance students would have research experience.

In [32]:

```

```

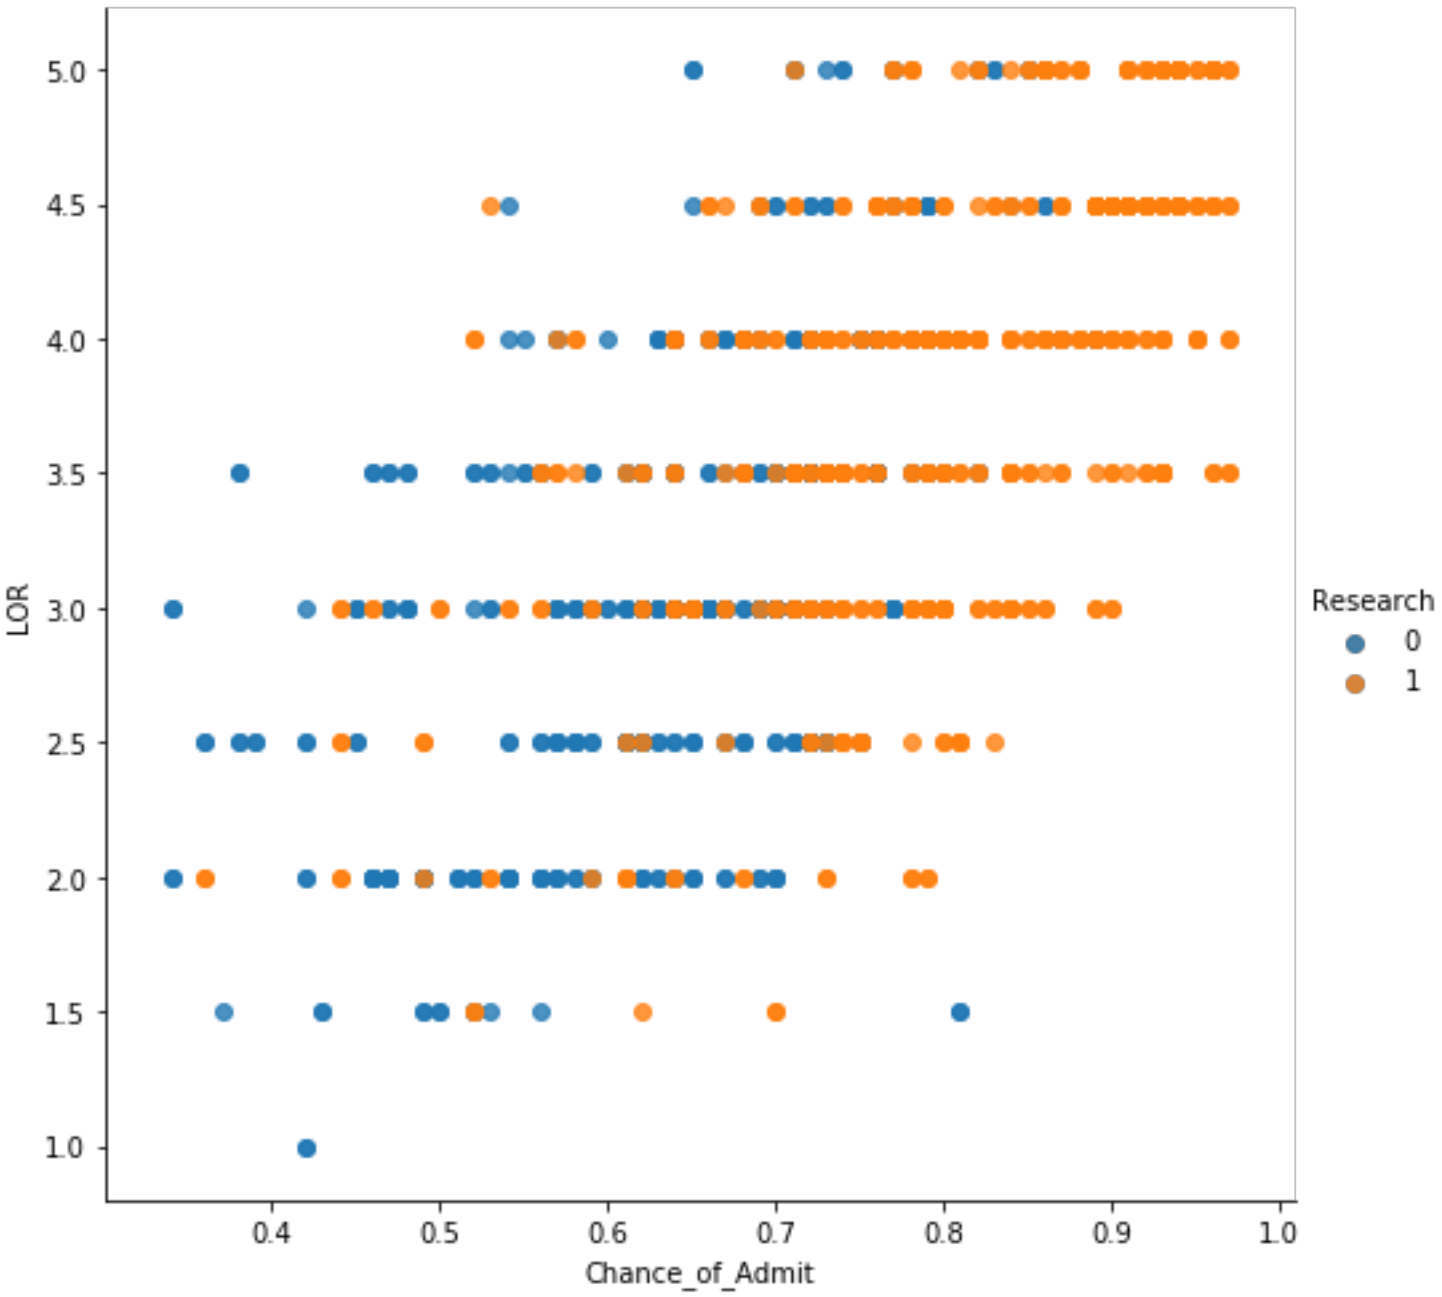
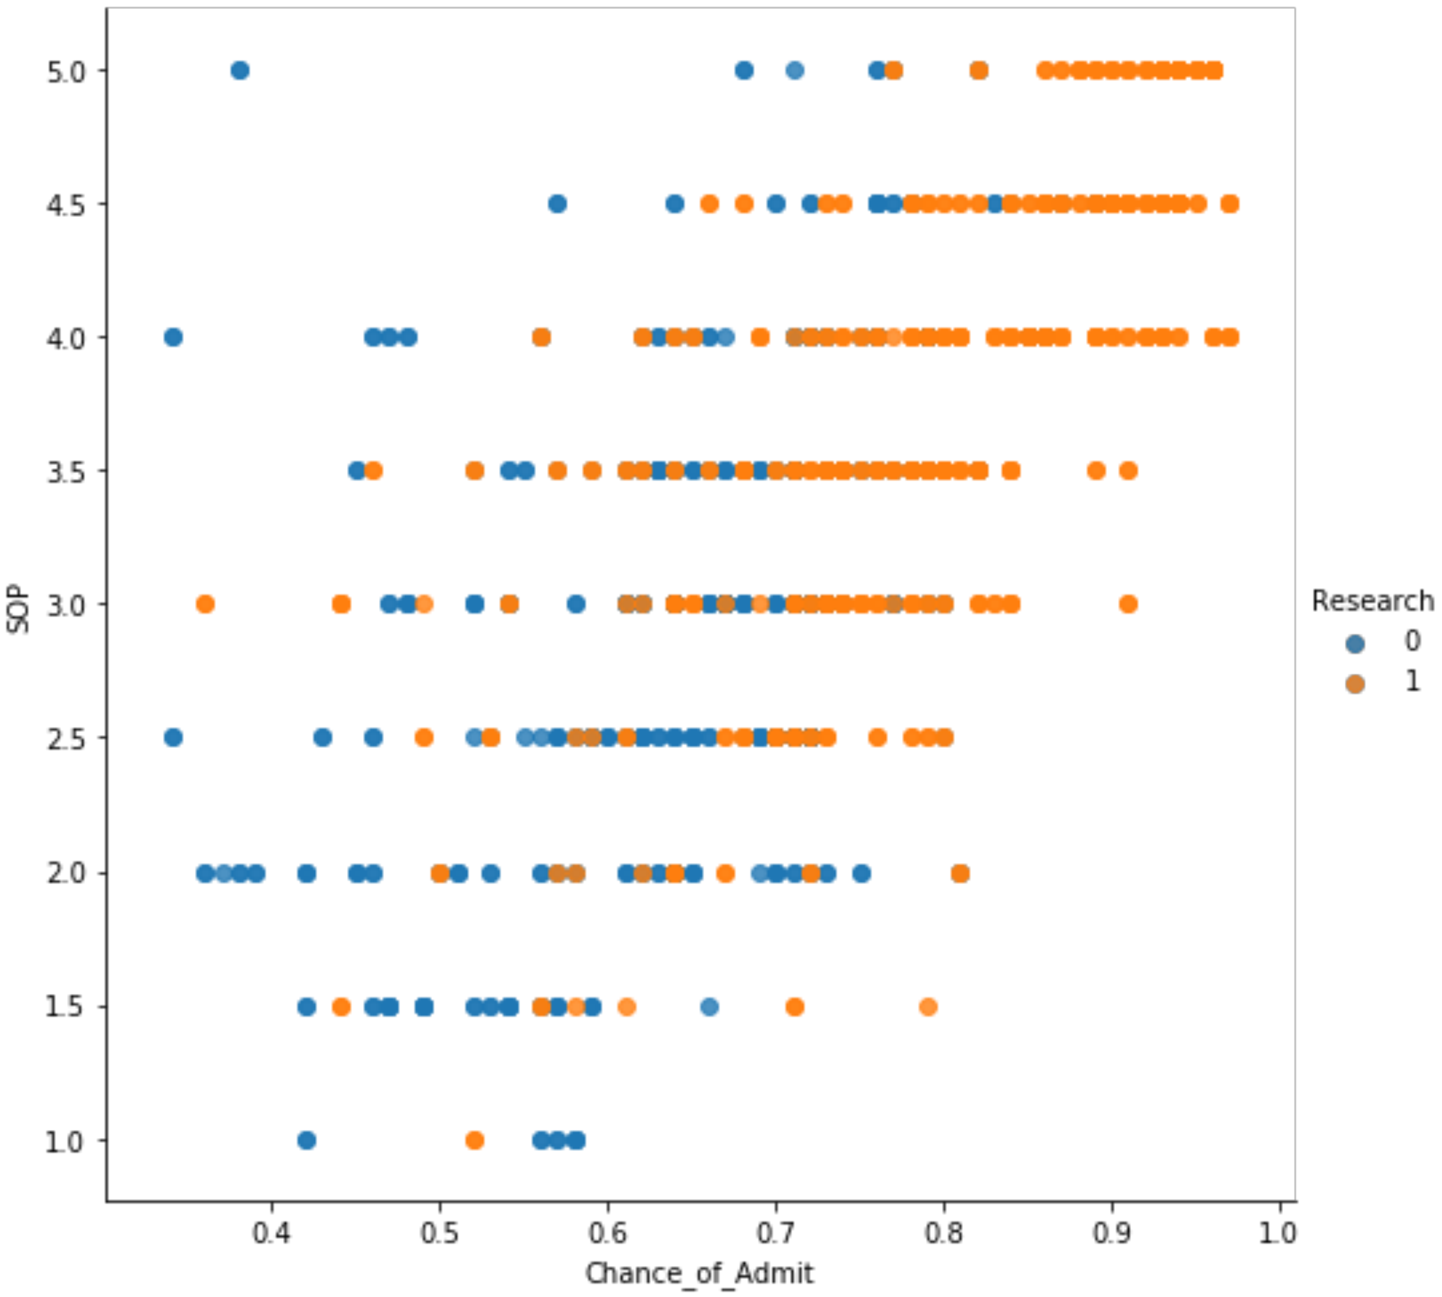
Higer university rating candidates would have a slightly higher chances of admit.

In [33]:



Higer level LOR candidates would have a higher chances of admit.

In [34]:



Higer level SOP candidates would have a higher chances of admit.

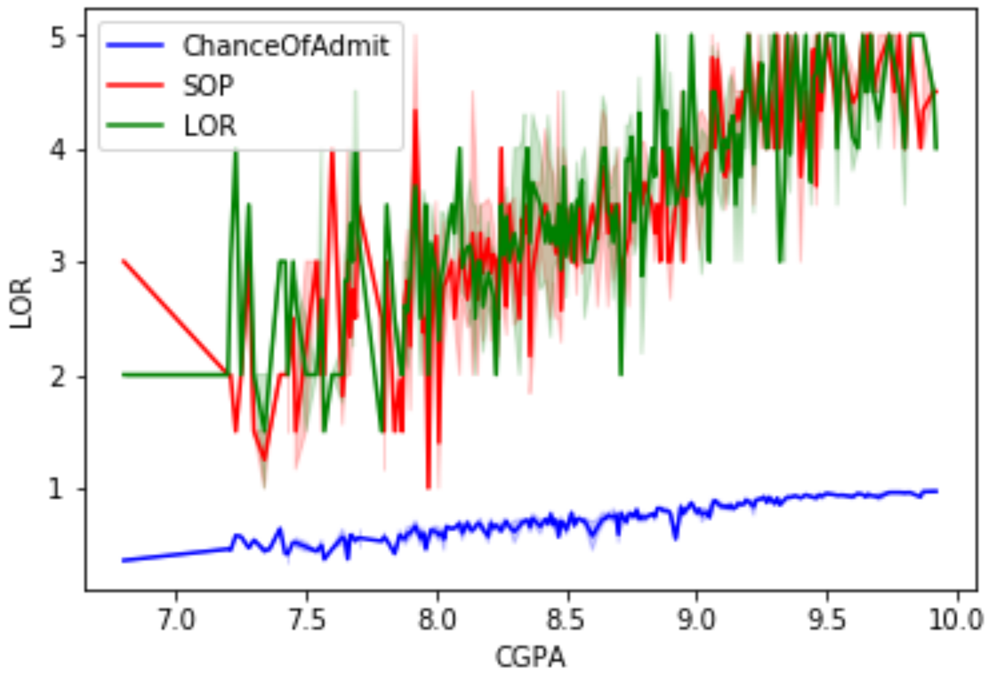
TOEFL_Score

In [37]:



From the data exploration and visualization above, we can see that student's GRE score, TOEFL score, and CGPA having more significant impact on whether they can be admitted or not; while university rating, statement of purpose, letter of recommendation show a weaker influence. Finally, students with higher admission rate usually have research experience. That is to say, research experience, though shows a relatively low correlation, weighs a lot in the admission process.

5. Regression Analysis

train_test_split:

It splits the data into random train (80%) and test (20%) subsets.

In [38]:

In [39]:

Note about r2_score:

We will use R-squared score to compare the accuracy for each regression model as it represents how close the data are to the fitted regression line. That is to say, the higher the R-squared, the better the model fits the data and makes better predictions.The best possible score is 1.0 for r2_score.

5.1 Linear Regression Model

Printing R2 Score for each model

Visualizing and comparing results

```
In [71]:
```

```
R2 Score for each model:
DecisionTree : 0.9375056949439617
Linear Regression : 0.804590919255666
RandomForest : 0.9488301647111792
KNN : 0.7612420294904299
SVM : 0.7462571620503973
Ordinary Least Squares: 0.8134478843618487
```

```
In [72]:
```

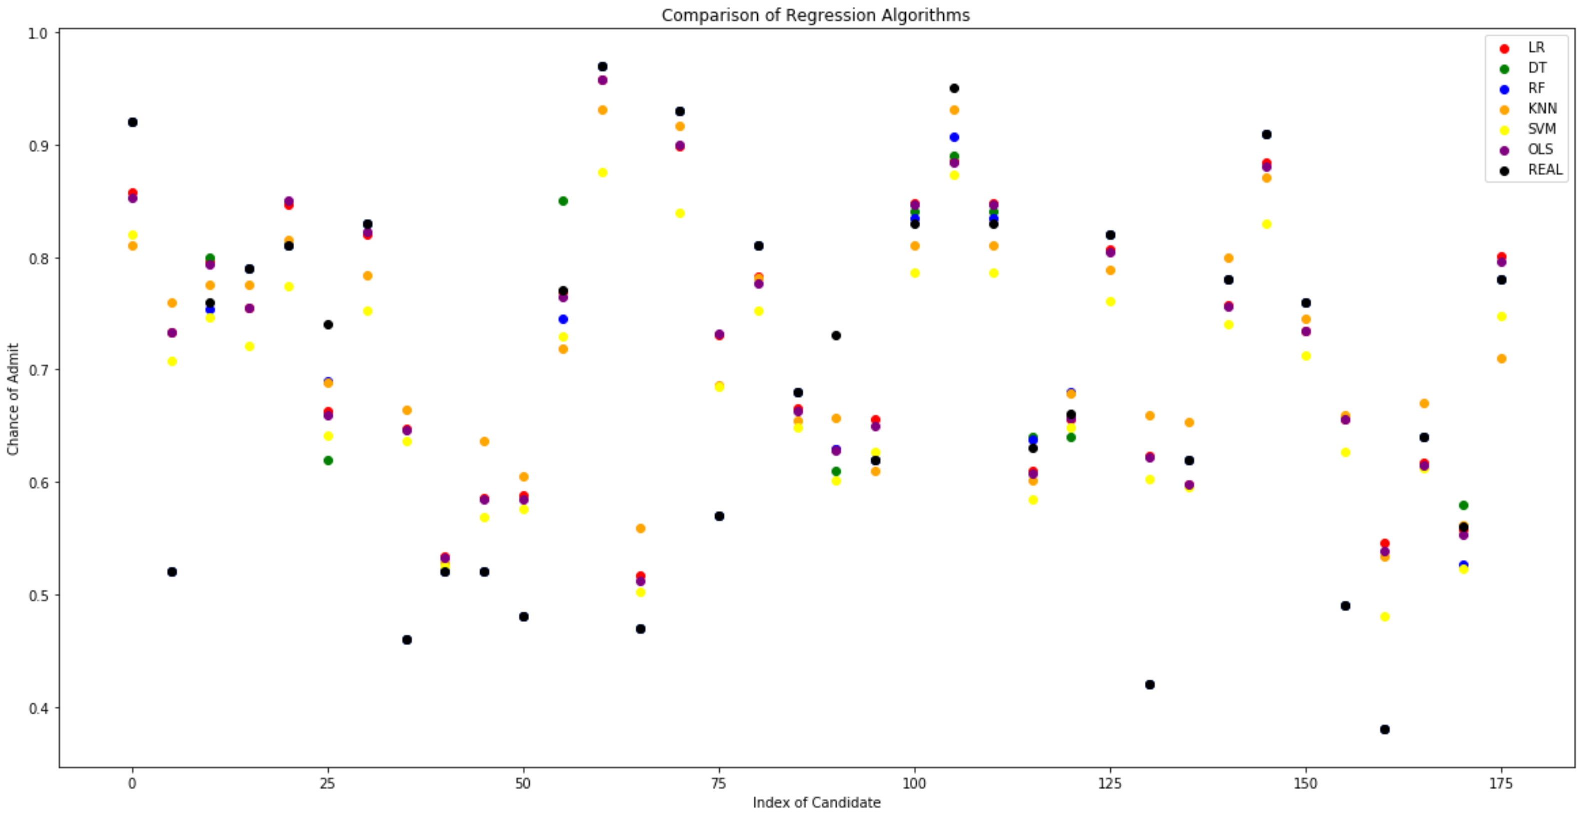
In [73]:



The best model is Random Forest which has the highest R2 score (0.95)

6. Conclusion and Summary

In [74]:

Out[74]:

```
<matplotlib.axes._subplots.AxesSubplot at 0x1a22597e80>
```

Feature Selection is the process to select those features which contribute most to the prediction variable or output.It reduces overfitting, improves accuracy and reduces training time.

The importances of variables are presented above, and GPA is the most important parameter

CGPA: 0.36

GRE SCORE: 0.23

TOEFL SCORE: 0.14

UNIVERSITY RATING: 0.9

SOP: 0.07

LOR: 0.06

RESEARCH: 0.03

```
In [75]:
```

```
Out[75]:
```

	GRE_Score	TOEFL_Score	University_Rating	SOP	LOR	CGPA	Research	ChancesOfAdmit
71	320	110	5	5.0	4.5	9.22	1	0.92
439	312	106	3	4.0	3.5	8.79	1	0.81
859	297	96	2	2.5	1.5	7.89	0	0.43
176	317	103	3	2.5	3.0	8.54	1	0.73
427	324	110	4	3.0	3.5	8.97	1	0.84

```
In [76]:
```

```
Mean Absolute Percent Error(MAPE):  2 %
Average Accuracy of the model:  98 %
```

The most important parameter is CGPA
The model is 98% accurate to predict admission status of a candidate
